Trying to get MT1000.EXE software running on my laptop. I get a com port failure. COM PORT FAILURE 003 or 005, Does anybody know if this software requires the com port to be set up via the dos mode command. Any ideas, of what may be causing this, or what the com settings are it's looking for. It never gave me any problem on my desktop pentium in dos window. Thanks for your help. Wade.

6. Looking for vernier drives with faceplates

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-01 00:00:00 UTC
From: erlpnk4yz@aol.com
Message-ID: <1998070104135600.AAA29197@ladder01.news.aol.com>
Source record: 81534

I am working on both a homebrew tube receiver, and a home brew tube transmitter projects, and need to find two Johnson vernir drives with the face plate/pointer for making a calibrated dial.

Also, if anyone knows of a good "one-stop shopping" spot (other than Fair) for older parts, ie: inductors, tube sockets, etc, I would deeply appreciate the help!

7. Cure for flaky Jackson Bros. Drive

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-01 00:00:00 UTC
From: Roy Lewallen <w7el@teleport.com>
Message-ID: <3599BD19.5E3BAE4A@teleport.com>
Source record: 81535

The Jackson Bros. drive I use for VFO tuning on one of my homebrew rigs has become flaky. It has a slightly rough spot, and the frequency jumps around pretty badly as the dial position passes through. My guess is that it's losing electrical contact through the bearing in that region.

The obvious solutions are to replace the drive or to work on the current path of the tuning capacitor to reduce the current going through the drive. Unfortunately, the rig evolved without a lot of advance planning. The drive was the first thing to go on, and the VFO has become badly buried in the many modifications made since. So I'm trying to find a fix which will let me coax a bit more use out of the drive without totally disassembling and rebuilding the rig.

Has anyone cured or at least reduced a problem like this? Has anyone tried the conductive lubricant manufactured by Cool-Amp in a similar application? All suggestions are welcome!

Roy Lewallen, W7EL

12. Are they charging by the word for subject lines now?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-01 00:00:00 UTC
From: aci6@aol.com
Message-ID: <1998070106081700.CAA11314@ladder01.news.aol.com>
Source record: 81540

OK, I know I am opening myself up for flames here - but I am just enough of a masochist to do it . . .

I have seen the following subject lines (titles, if you will) on newsgroup posts recently (the titles have been altered slightly to protect the authors - I don't know why - it just seemed like a good idea):

icr2099
RelTex EM6TB
TF-740
TSQ Piece
PGDS
Manatee scope
Tomo Clam Cover
SMDA D1

Now, I don't know about the rest of you, but I just don't understand the need for such brevity when composing a subject line. Are these items for sale? wanted? on (heaven forbid) eSell? what?

If one is selling a PGDS, it would be nice if they included "FS" in front of "PGDS". On the other hand, if the reader knows nothing about a PGDS and this is a request for info on same, a simple "Need info on" in front of "PGDS" would steer them away from that post while attracting those who were familiar with the subject.

The point is: if you are selling, buying, wanting info, etc, PLEASE include this information in your subject (title) line - you will be doing yourself and the rest of us a big favor!!

Regards,

(Soon to be) Asbestos Bill

13. CTCSS decoder

Roy: The Jackson drives in my Heath HW-101 got really "squirrley"
when the lubricant dried out a bit. As I recall the situation
improved dramatically with just a few drops of ordinary oil.

>

You don't describe what sort of experience/knowledge you've built up so far. There are plenty of kits out there, but there is nothing that is as clearly presented as Heathkits were. Some of the worst kits that I've seen really needed redesigning to make them work. I suppose I'm fairly well known as a technical type with a shackful of test gear, so just about anyone in the area who can't get a kit, or something built from a magazine article, going seems to wind up looking for me.

One of the members of the local club built the Ten-Tec 2 metre kit, but didn't get it going first time. The instructions were quite good for assembly, Ten-Tec were very helpful when he contacted them, but after changing a few suggested parts without success, it really needed a hands-on session with a scope, and a little familiarity with the synthesiser chip concerned - it could also have been sent back for repair, but I was an ocean nearer. On the whole, I was favourably impressed with the radio and thought Ten-Tec handled a tricky problem as well as could be hoped for. If their HF kits are done as well then this may be your best choice.

For highish performance HF kits, I reckon that the best I've seen are the "Hands" kits. Sheldon Hands is a pretty decent chap, and his kits have got quite a following. His stuff has been used as the prime communications on trans-polar expeditions - so there are people prepared to place large amounts of trust in him! He does multi-banders, and even has a DDS VFO.

IF you build a kit and it works first time, you learn little but get a bit of practice at assembly.

IF you build a kit and overcome a few problems, you learn a lot more, and get a tremendous boost of confidence.

IF you build a kit and fail to overcome the problems, you might learn a little, but it's one of the most discouraging experiences possible.

At the age of 13, I experienced the third of these. I was annoyed and set out to find what was wrong. I didn't know anyone I could ask for help, so I started reading. After what I learned over the following few years, I would have cheerfully throttled the designer and vendor of a kit that wasted so much of my savings. Today, I'd thank them for starting me off on a career,
first ;-)

Cheers
David GM4ZNX

18. Antenna preamp lightning protection

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-01 00:00:00 UTC
From: Maurice Marks <maurice.marks@nospam.digital.com>
Message-ID: <01bda4f8$29c6c8e0$6c107710@amtnt5>
Source record: 81546
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

I'm designing a BCB/SW active antenna that will be located outdoors about 20' up
outside my window. Its a simple JFET source follower followed by a broadband common emitter
amplifier design. Powered through the feedline from a Sony SW receiver that provides 3V for an
active antenna.The antenna probe is a car radio style whip 3-4' long.

With the almost daily thunderstorms we've been having here in the Northeast I'm getting nervous about
static electricity and lightning protection. My plan right now is to run a solid ground from the preamp
straight down to a ground rod below. A 4M resistor shunted by a neon lamp from the antenna to
ground to bleed off charge and shunt spikes, and a MOV device across the preamp output in case
the preamp gets fried. I expect that the front end stuff wont add much cap or voltage drop, and
although the MOV is likely to add some cap to the load it probably wont be a big problem at 50ohms
and at the frequencies in question (<30MHz).

So, do you think these precautions would reduce the risk of the radio getting fried? Do you
have some other suggestions or experiences that would help?

thanks
/maurice KV1D

19. CA3054 from Hard Drive

Newsgroup: rec.radio.amateur.homebrew

I took apart an old hard drive recently and spied a couple CA3054 chips.
These would seem to be useful for building a double balance mixer (dual
monolithic differential amplifiers). Anyone used this chip in that
application? Any comments, suggestions or circuit ideas?

This is pseudo homebrew related...

Howdy all.

I would love to hear from some of these 11A's and 26A stations
that I was working during field day, on how they managed the logs.

I know there has been a growing trend of having computers in the stations,
that is nothing new, however networking them all is somthing that I think will
be the next migration for my club next year.

Any comments from any of you all who DID run networked computers?

What did you use? (hardware, software etc)

Thanks, jason n1rwy

> In parallel: voltage stays the same, current increases.
> In series: current stays the same, voltage increases.

As someone who got my first ham license in 1980, I just have to ask this. Is it
really possible to
pass the exam for ANY class of ham license in the United States today without
knowing the
difference between wiring batteries in parallel vs. in series?

I strongly supported the creation of a no-code license. But a post like this
makes me think that
perhaps the old fart's worst fears have come to pass.

A pair of reverse-biased diodes to prevent the gate of the FET from rising above the DC supply or below the chassis potential is strongly recommended. The FET may have one of these diodes built in internally.

Otherwise a lightning strike up to a mile away may ruin the FET.

Also maintain a low DC resistance, less than 3000 ohms, between gate and ground. Don't allow a static charge to build up. You may have to use an RF choke.

The diodes and choke will reduce receiving sensitivity at both low and high frequencies. Try and arrange for the choke and stray capacitance to resonate at a frequency you are mostly interested in.

Mr. Belton,
Just because you passed your first ticket in 1980
does not give you the right to act like an ass.

I see you have been busy increasing your knowledge in
the past 20 years of ham operating as well as finding time to
slam on people like me.

What is your class now? A Tech plus?
(As I look on QRZ)
You are a Tech plus.. wow, the same as ME.

So guess what.... SCREW YOU!

It is now quite obvious that YOU and not I should be the poster child for
educational achievement in ham radio.

It could go something like this :
**
"Don't waste you time upgrading your license boys and girls! "
Be like me! If you think the question that someone asks is stupid,
SLAM THEM!
Why upgrade? You can be like me and rant and rave!
**

I asked a simple question so that others who have
done this could maybe pass some knowledge on to me.
What did I get in return?
An ass who felt the need to "one up" someone.

Hell, I know I could find a question that you would not remember either.

Please do not pass your anti-ham anger against the
"Technician class" out on me, all it does is push away those who
might have a question that could be easily solved.

You had to take American history in school right?

* Quick name all the past presidents.
* Better yet, name all the capitals in all 50 states..

What you missed one?

Is it my turn to now slam on your educational history?
Or is that already evident by what you have stated above.

Hump.. help.. is that what HAM radio is all about?

"moving on, seeking knowledge.. not letting idiots slow me down."

As long as you don't intend to set up shop in their service area, lots of broadcast station owners and engineers will be glad to answer any and all questions you might have about starting up a station. On the job experience can be very valuable too.

The various forms you have to fill out are mostly very simple one page affairs. The hard part is making sure everything on them is truthful. Most people going into the broadcast business will hire a consultant to assure that, but you don't have to do that. Just do your homework and be careful. The one sure way to be denied a license is to make a false statement on the application forms.

There are a number of used broadcast equipment dealers who can equip you inexpensively. Most advertise in Broadcast Engineering or in Broadcasting. You can equip from Radio Shack if you like except for a few items which do need to be Type Accepted. They are the transmitter exciter and a modulation monitor. They shouldn't cost more than a few hundred dollars from one of the dealers in used equipment. (It doesn't matter how old it is, if it was ever Type Accepted, it still is.)

And BTW, forget about FCC inspections, in the old days it was
fairly rare for a small station to be inspected. Today it virtually
never happens. The FCC doesn't have the field staff to do it.
You file a form in your records every year saying everything
is fine and they take your word for it.

>If I understand you correctly, licensing is not particularly costly when nobody
>else is interested in your market. I certainly did not know that. Now, what
>would be my course of action... file application for a license, and then the

>bidding war for a freq? Can they object on grounds that I am digging into their
>market even though I am not interfering? If that is the case I would probably
>have problems, as most of the audible FM stations are here on the U.S. side.

The first thing you want to do is check the table of allocations to see if there
is an open channel assignment for your community. Quite a few communities
do have open assignments for one reason or another. The FCC assigned
channels to most communities many years ago, and some have never had
a station on them. In other cases, someone petitioned to have a channel
assigned and then didn't follow through to put a station on it. And in other
cases, stations failed and are off the air. If any of those cases is true in
your case, you're practically home free.

But if there is no open assigned channel, then you'll have to petition the
FCC for one. You should do your homework on this and make sure that
there is a frequency which meets all the FCC spacing requirements first.
You can hire a consultant to do this for you, or you can do it yourself.
The separation requirements are in the rules, get a copy, and the FCC
database of all existing stations is public record. So get a map, plot out
the separation requirement circles on it, and plot every station that falls
in the circles. Then check them against the separation rules until you
find a channel with no conflicts. With the small number of stations you
say you can hear, that should be easy. Now petition the FCC. There is
no fee for this, but there will be a public hearing.

This hearing is where you can expect opposition. Anybody and his
brother can object, but the FCC expects them to have a good technical
reason for objecting. Unless another nearby community is in the process
of filing for the same, or adjacent, channel, this should go smoothly.

Now once the channel is allocated, anyone can file for a license to
put a station on it (except owners of other stations in the area, they're
forbidden to compete with you for the channel since they already have
one). So you want your application ready so you can file it the second
the assignment is announced. It is likely that there won't be a competing
application in your case, but if there is, there will be a comparative hearing
to determine which party is better qualified to serve the community. This
can get sticky, but the FCC gives priority to local community people
over outsiders, so if you're the only one in town to file, you've got a
very good chance of prevailing. (There's a minority preference too,
so it might be a good idea to have a minority partner if you expect

a competing filing.)

Note, if you even remotely expect a competing application, you need a DC lawyer to handle things for you. Otherwise all this stuff can be handled by mail.

The FCC generally prefers for you to file for the highest allowable power and antenna height for your license class, but they don't absolutely require that. It will be a point in your favor if there is a competing application, however.

Now assuming that you do prevail, you'll be issued a construction permit and will have one year to get the station on the air. Once it is on the air and passes proof (you certify that it is operating within the conditions of your construction permit), you can file for a permanent license. This is routine, and should not be a problem. There is a license fee. But it is on a sliding scale depending on market size and class of license. For a Class B or C in a top 10 market, it is $10,000, but in your case it should be $100.

Unless you have opposition during channel assignment or during the license application, you'll be out net $100 plus some postage to be the proud holder of a broadcast license. The process takes from 3 months to a couple of years depending on opposition. In your case, the minimum time is likely.

Because this process is really simple, and because the cost is low, I am amazed at some of the things people say about how broadcasting is expensive and only megacorps can do it. In small markets, this just simply isn't so. Now in the top 10 markets, that's a different matter. The audience sizes are huge, and the competition to have a station to serve them is intense because the profits to be made can be very large. A good top 10 market station can earn $5 million a year or more. A small market station will struggle to clear $35,000 a year for its owner. It is mom and pop stuff.

Hi Roy,

I've tried to do this several times, I tried heating up the drive and rotating it ,which worked to a certain extent, another time I tried a really thick oil since the original stuff seemed quite viscous, also tried thin oil but that made the drive lose traction.

Sorry, but I never found a successful method !

It should be possible to also use that 3V to activate a couple of
reed relays that actually (1) disconnect the antenna from the
semiconductor, and (2) ground the preamp's input line. Both of these
operations could be done with one spdt relay. This should protect it
when the preamp is off.

Thanks a mill, Gary. Very good post! I appreciate your taking the time to share so much info all at once. No doubt you have helped others with this post who were also contemplating pirate LPFM. You really ought to write a book on this topic, OM. That class C License is starting to look pretty interesting.

Clear 35K? Hell, I worked my BUTT off to make 43K last year in all kinds of miserable weather at risk of life and limb daily. Plus I sure as hell ain't getting any younger. that kind of money for runnng a radio station? Most of us hams would do it for free if the bills somehow paid themselves. I was just hoping to do a bit better than break even. Mainly I just wanted to get my teeth into the technical side and provide a locally oriented info-tainment resource for our little town, and maybe give some of the more promising local kids a leg up into a tech oriented field.

Thanks for one of the most complete replies to a post I have seen on this ng for quite a while.

The program range is whatever the radio is spec'd at. As far as which two pins to short, I would need to find a manual and look it up. Also, my statement is specifically in reference to the EPH model HT. I just now realized you cited a different model. This may not be applicable.

Ditto on e-mail. I once got a letter by snail mail from a ham who e-mailed me three times with info I had requested. OOPS! I deleted all three without reading because the subject line, like so many junk emails, said simply "Hi there!". I trash about 30 pieces of junk email a day, and if a subject line does not look like something important, and does not indicate the contents of the email, it goes too. Let's be descriptive!

You can also use a special "starter" solenoid which is rated for
"continuous service" (contrasted to "only on while starting")--ask
your local auto-supply store, and use it to connect the "second"
battery to the alternator (essentially in parallel to the original
vehicle battery) whenever the engine is running. I added a second
battery to my pick-up several years ago ('cause I kept leaving a
radio on, or an extra-bright reading lamp, or ....) and have had
no problems. A little extra wiring (another starter solenoid and
a selector switch) and I can start my vehicle from EITHER battery,
just in case the original fails.

I would have thought that a 741 would be woefully inadequate over about 100
kHz. I wouldn't mind taking a look at the circuit. Got a URL for it?

Wow... I must have gotten a real bargain. I bought a used but immaculate one for $75. I still use it when I am not using a homebuilt bug.

39. 40 m antenna

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-02 00:00:00 UTC
From: ed <emontana@interlog.com>
Message-ID: <01bda56c$9cb376e0$d2cb22cf@emontana.interlog.com>
Source record: 81567

Hi!, all.
Recently (after getting tired of DX on 10, 15 and 20) I've been researching for a good DX antenna for 40.
And after all it is said and done it still is true: "the bigger the better".
I was looking for material for a quad (on a 40 ft. boom) but I think it may not be worth the effort. I live in the city (40ft wide lot) and although the neigbours are exellent would like not to get in their property (at least when the beast is "parked").
That was a nice reason to attempt a quad.
But up here in Canada fiberglass suitable for canadian wheather does not come in easily nor cheap.
In the ARRL antenna book I found a "shortened" version a 40 m (on a 36 ft boom) that uses capacitance hats and a couple of coils.
It streaches a beautifull 38 ft. or so.
My question is the following:
Does anybody know where up here in Canada I can get alluminum tubbing (not pipe, I got the boom already)?
Does anybody have 1 3/8OD, 1 1/4OD, 1 1/8OD I can get my hands on cheap?
I need the following:
Good quality T6 series:
18 ft 1-3/8OD (3x6 ft).
30 ft 1-1/4OD (6x5 ft).
34 ft 1-1/8OD (6x5.66 ft).

OR
If you have fiberglass poles and spreaders (big and strong) enough for a three element quad on 40 give me a shout!!!!.

I have a nice TS820S (with some toys) I'd like to swap or we can talk price.
I am located in Toronto, Canada.
You can e-mail me at: emontana@interlog.com
Txs,
VE3YZR, Ed Montana.

Can anyone point me to a good Capacitance Meter circuit,
either on the web or print. I believe 73 MAGAZINE had an
article on a simple add-on circuit for DVM's, anyone
remember the issue/article? Picofarad range -if possible.
Thank you, and 73 all...

50. VFO stability question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-02 00:00:00 UTC
From: J Samuel <jaysam@deletethis.deletethis.caa>
Message-ID: <359B9DC5.5A92@deletethis.deletethis.caa>
Source record: 81578

Hi all,
I have a OHR QRP explorer on 20m. I am having a lot of fun using
QRP. But the VFO seems to shift as I am receiving (have to use the RIT
often in both directions) and yesterday stns were giving me QSB from the
tx end too. Is there anything I can do to stabilize the VFO and stop it
from drifting ?
Any web sites that can give me info on OHR QRP explorer mods to
accomplish this ?
Please post replies to this newsgroup.

Thanks,
Jay Samuel

A gorgeous cure for this sort of problem is Spaargarrens' Huff n' Puff frequency stabilizer. Latest publication in February 1996 QEX, several earier incarnations. It will lock that VFO to a crystal within just a few Hz of where you want to be and KEEP it there. Simple, effective and does not add noise to the oscillator.

Frequency stabilization of LC VFO's by Spaargarren

It's also small, compact, lightweight, silent running and low fuel consumption.

Just thought of another option, Bill Carver, W7AAZ just published an article in the last issue of Comm Quarterly for a frequency counter for VFO's. It has a feature of looking at the last digit on the counter and locking it up. ie, generates a control voltage to be fed back to the VFO to keep that digit constant.

CORRECTED 7/2/98

FOR SALE

All items are new, old stock unless noted otherwise.
Prices shown are for each lot in $US. All offers will
be considered. WE WILL DIVIDE ANY LOT. E-mail or call
for pricing. Prices do not include shipping. All
items ship from Philadelphia, PA.
We accept AmEx, Bravo, Discover, M/C, Novus, Optima and Visa.
Minimum C/C order is $35.00.
Terms: Payment with order. COD available; Add $5 for UPS.

To Harry.

I think I have one in my junk box. If I have it, I can sell it to you. It is unused chip that I bought long time ago to make a PMP (Poor Man's Packet). Just cross your finger and I will let you know tomorrow.

Kenwood TS-180.
This is the all solid state 10 - 160 ham band only tranciever with
provisions (but not included) for any 2 of the WARC bands.
Runs 100 watts and has been a great radio for me the last 4 years.
Has the 250~ cw filter installed. With both Operator and Service Manuals

Also included is the: PS-180 matching power supply
SP-180 matching speaker
AT-180 matching tuner
MC-50 mic.

All in good condx. Will ship anywhere in lower 48 .....
$500

60. Re: Antenna preamp lightning protection

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-02 00:00:00 UTC
From: flanders@groupz.net
Message-ID: <359bfb73.19667610@nntp.groupz.net>
Source record: 81588
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Nearby lightning can induce a pretty good jolt of RF into the front
end of the preamp, regardless of a DC ground. A physical disconnect
will reduce this risk.

Does anyone know of a good place (preferably online) of where to get info on building your own rubber duckies or other wound antennas??? Secondly, I have been searching endlessly for a schematic of a small transmitter in VHF/UHF range FM that is crytstal controlled. If anyone has one or knows where to get one could you PLEASE pass it along??? THANK YOU!!!!

--

Does this work?: (probably not)
Pursuant to 47USC227, any unsolicited commercial email sent after 72 hours from the time of this reply will be subject to the following fees: 1. Each message will be subject to a $500 (five hundred dollar) downloading and archiving fee. Terms are NET 10 days from date of downloading, 18% APR after 10 days. 2. Each message older than 30 days will be charge $1 (one dollar) per day for each kiliobyte of disk space used until the downloading and archiving fee is paid. 3. Each meassage will be erased when all fees are paid.

Something close and easily available: Radio Shack has a 4A-hr 12V
sealed lead acid battery (that is what you mean by gel cell, right?)
It is a little expensive, but the availability is great.

66. More abt "the twin-xtal super VXO"

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-03 00:00:00 UTC
From: la8ak@online.no
Message-ID: <359d59c9.13642694@news.sol.no>
Source record: 81468

In last issue of SPRAT G3ESP describes a simple VXO tuning 3509-3587kHz. It uses 2N2222 in a collpitts oscillator, a 9.1uH coil, 30pF tuning capacitor, xtals on 17642 and 14060kHz. He mentions that using 8863.3 and 8998.5kHz xtals the oscillator may tune 135.7-137.8kHz LF frq's. I suppose the difference between the xtal frequencies produce sort of intermediate frequency output. See page 9, SPRAT #95 Summer 1998 (G-QRP Club)

I am not sure if it is worth using VXO to cover 80m cw band, since a color burst ceramic resonator at 3.58MHz will easily tune 3495-3630kHz in a colpitts oscillator using 2N2222 or BC547, but the principle using the super VXO is indeed interesting.

In Radcom TT June 98 pg 61 G3VA refer to twin xtal super vxo investigated by VK1PK, based on Japanese technique described in 1980 by JA0AS and JH1FCZ. (In my opinion the circuit shown by VK1PK is not series resonnance circuit, but parallell resonnance with coil in series with the tuning capacitor). A list showing the improvement between using single and two xtals in the oscillator. It seems that VK1PK has only used two equal xtals, I believe somebody on this NG suggested to use slightly different frequencies to cover larger range.
Ex.: A single 7159 MHz xtal tunes 7151.75-7160.80 (44uH coil), but twin xtal circuit tunes 7135.93-7162.95kHz

Depending on how you define "kit," SSB CBs can be converted to 6M use.
I have several files on the subject, which I would be happy to send by
email if you are capable of receiving attachments.

Carl,

I remember seeing this in the 1962 edition of the ARRL Handbook. I
built a band switched amp of similar design.

I have the 62 Handbook and after the holiday I will try and look it up
for you. If necessary, I can copy it and mail it to you or perhaps scan
it for you. Let me know if you can receive html.

73. 6M SSB Kits?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-03 00:00:00 UTC
From: Bob <bobmcn@globalnet.co.uk>
Message-ID: <6nh3s2cco1@heliodor.xara.net>
Source record: 81592

I saw a posting a short time ago about a good 6M SSB kit. Can anyone recommend such a kit?. I do have access to all the test gear I might need Sig Gen, spectrum analyser etc so building this is no problem for me. I do want a complete kit as I have come across designs before where just the PCB is available, and there is ALWAYS some "special" component you just cant find that is critical to the design. There are bits that you just cant get for love or money here in the U.K that in the U.S are no problem to source, if you can get them here someone wants an arm and a leg for them!!!. There is no such thing as cheap gear here unless you build it, and so many people now wont or cant!.
I do need a kit for a stand alone 6M SSB rig as I have no other SSB rig so a transverter is no use at all to me. I hope someone can suggest a good kit. You can reply to this group, or direct to me Email.
Many thanks.

Indeed well worth considering, but addition of RIT (Receiver Incremental
Tuning) could possibly reduce the problem considerably.

A rotatable beam works. But a better solution is a doppler DF unit.
A suitable design, the Roanoke Doppler, is in _Transmitter Hunting
Radio Direction Finding Simplified_ by Moell and Curlee, published
by TAB books. This book has comprehensive DFing information
and is worth owning even if you decide not to use a doppler system.

Have about 40 used 6 and 7AH 12 VDC gel cells for sale. Also have about 10 4AH 12 VDC cells. All load tested good. PERFECT for QRP rigs and portable operation. I have sold hundreds of these to the QRP boy's on the QRP mailing list and all have been very satisfied. Had a few damaged in shipping and one came back DOA which I replaced for the fellow free of charge but that's it. I am the service manager for an alarm company and we change our customers batteries every 3 years as preventive maintenance. These used cells should provide another 2 to 3 and probably longer service if used and recharged properly. Cells come fully charged and are ready to go. They can be recharged with a simple wall wart charger available at Radio Shack or a 1 amp automotive charger. I guarantee against DOA.
Brands are Yuasa, Interstate, Radionics and Portalac.

4 ah cells are $8 shipped CONUS
6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

If you buy 2 of the same I will knock $3.00 off the total price.
Images of the cells can be seen at:

http://www.usol.com/~tje/yuasa6.jpg Yuasa 6ah

Jay:
From your post, I assume you are using a single RV-Marine battery.
These batteries are about the same size as a car battery, and have
RV-Marine type words on the label. I suggest you wait until your
present battery fails, and then switch to golf cart batteries. They
are 6 volt batteries, so you will need purchase two and connect them
in series, plus to minus. I understand they are true deep cycle, while
the others are semi-deep cycle. They are a little larger than a car
battery, and weigh about 60 lbs each. One disadvantage: no battery
cases are available.

Consider problems involved in moving these batteries. Initially, I
looked at Sears, but none were immediately available. I looked in the
yellow pages, and bought an "Action Pak" (I think, I'll need to look
up the info). The dealer had a nice carrying strap, not the kind that
connects to the terminals and sometimes slips off. Sears did not have
this feature.

Another point: storage batteries are non-linear. In other words, they have much more capacity at light loads than heavier one. That's probably why the ampere-hour designator is no longer used. With golf cart batteries, you should be in good shape.

Also get a battery charger that says it is designed for deep cycle batteries, and keep an eye on the water to insure it doesn't drop below the top of the plates. Low water is really bad. I know from experience.

Originally a LOT of rptr coordinators set 145.1-145.2 aside for
LTs and other allmode experimental systems.....but there was only one
or two LTs ever built and put in svc nationwide that I know of...
and they were both narrow banded...15-20 Khz wide....so the thought of
reserving the entire 100 Khz was lost....
TX did the above when 145 was first opened to rptrs....but 2 years
later, 145.11-145.19 were opened for FM rptrs....and the LT allocation
was eliminated.......(not that you cant put one there....but you have
to get it coordinated as a rptr....and likely run it narrowband....not
like the Oscars...besides LTs have a inherent problem with power in vs
power out.....the CLOSER you are to it, the STRONGER the output signal
to others will get.....In space, a LT is pretty much the same distance
away....on the ground, thats a different story and problem!)

90. 813 Amp Design Info Wanted

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-03 00:00:00 UTC
From: Carl Clawson <76516.1330@CompuServe.COM>
Message-ID: <eas#twqp9GA.268@nih2naac.prod2.compuserve.com>
Source record: 81609
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I've picked up a homebrew amp that uses a pair of 813's
paralleled in a grounded cathode configuration. (Actually, it's 5
single-band units with a common power supply switched among
them.) It's a very simple circuit with a link coupled input and
pi network output. The tubes are completely in parallel except
for small suppressor coils in series with each plate.

I haven't yet analyzed or turned on the bias supply, so I don't
even know what class of operation it's designed for. (It's from
an estate sale, so I can't ask the former owner.)

I suspect it was built from an article in a magazine or handbook.
A similar amp in class B grounded-grid was published in the
November `61 QST. If you know of an article describing this type
of amp, or any good source that would help me analyze it, please
let me know. This is my first venture into the tube world!

Thanks & 73,
de Carl WS7L

Dear All,
I desperately need a manual for a Rohde and Schwartz wobbulator. I've even tried R&S but they havn't got one, this being seriously obsolete. It basically works but need calibrating and a good overhaul.

It is an R&S Sweep Signal Generator type SWF, built, I guess, late 50s early 60s. If you know how to align one and can write it down then this would also help immensely

Regards

Robin

What designs have you looked at? What parts do you find difficult to
obtain?

I've seen all sorts of homebrew 6m transverters, but only recall seeing
one dedicated 6m transceiver. It was reprinted in _QRP Classics_ and
would be tough to reproduce now.

You may have to build or adapt something yourself. I'd pull bits from
a couple of different places - probably use one of KK7B's direct
conversion receivers and phasing SSB exciter as frequency-independent
jellybean prime movers, and then add the preamp and PA stage from the
6m transverter in the _VHF/UHF DX Book_. You're on your own for the
VFO, but they're easy.

There's nothing that says you have to use KK7B's designs - there are
all kinds of direct conversion (phasing, polyphase, Weaver) radios
out there. By using direct conversion the only really frequency-
sensitive parts are the VFO and the antenna. Until you add the PA
and preamp, anyway. :-)

Unless I'm missing something, all the bits are available from folks
like Cirkit. Except possibly for the PA brick, which you should be
able to get from somebody like Mainline.

All the usual disclaimers apply.

>xtal circuit tunes 7135.93-7162.95kHz
>---

Well, things have moved on since then. One of my favourite pieces of equipment is a 40m portable DSB/CW transceiver that uses crystals of widely differing frequencies to tune a large frequency range. This transceiver uses a crystal on 17.24 MHz and two crystals (in parallel) on 10.24 MHz. I can get the 10 MHz crystals to cover 90 kHz. The coverage I get is 7.005 - 7.095 MHz - perfect for the Europeans. The whole thing is a simple 1 transistor circuit. Amazingly the freq coverage is almost linear (unlike most VXOs).

An article on my experiments is awaiting publication, and may well be picked up by Pat Hawker when it comes out.

I have found two crystal mixer-VXOs (when the xtals are used to get a difference or sum freq in a single transistor oscillator) be a bit unreliable. Sometimes one of the crystals doesn't work. However, it will when the other xtal is disconnected. However twin crystal VXOs when the crystals are on the same frequency are very reliable and always seem to work.

My latest VXO circuit uses conventional mixer/oscillator circuits. It uses a single 10.24 Mhz xtal in a VXO. This is mixed with a 3.2 MHz xtal. The difference is 7.005 - 7.035 MHz. This is used as a VXO in a 40/20m DC CW transceiver (doubling used to get 14.010 - 14.070 MHz). However with these types of circuits you need extra filters to suppress the 10 MHz and other components. BTW the T/R freq offset is achieved by diode switching a capacitor into the 3.2 MHz osc circuit. However, the offset is 400 Hz on 40 and 800 Hz on 20m, which is a disadvantage on 40m, but better than no offset at all.

Hope these notes have been of use.

Dear All,
I am working out how to mod a BOSCH KF163 PMR set for 2 Meter use. It has an RCA EPROM which holds the programming data. It is an 18U42CD. What is this, I have never heard of it. If someone has a device description they could send/fax/write to me that would be very useful.

Alternatively if someone knows how to do Bosch KF163s that would be a help.

Cheers

I have no opinion on how the batteries are connected, but some real doubts about charging two parrallel connected batteries. The charging characteristics of any two batteries are never the same, thererfore one battery will charge more than the other. To avoid this, the batteries physical position should be rotated periodically to balance the charge to each battery. I am not sure, but I think this has something to do with Kirchhoffs Law.

When Heath brought out their Q-Multiplier it was one of the hottest devices in ham radio; crystal filters were only available on the more expensive receivers.

A Q-Multiplier is a simply regenerative circuit (a Colpitts works great) where an L/C tuned circuit is hung across the IF amplifer output. Regeneration control allows a fantastic increase in the Q of the IF tuned circuit, while an IF tuning range shifts the peak back and forward across the IF bandpass. If you put the Multiplier into oscillation you have a beat oscillator for CW or SB.

Do a Yahoo search for QRP and you will find a number of simple Q-Multiplier circuits, the best using FETs. There are also several audio filters using R/C networks.

As Frank says, it's called a 'transverter' and it usually includes a receiving down-converter too.

My web site gives more details about the book, including a list of contents.

The ordering details that Frank gave are out-of-date. You can order it from either RSGB or ARRL (both of whom take credit cards), in each case by mail/phone/fax/www, and there are direct links from my web site.

Berak, Break.
There is no such thing as Watt's Law.

There is Joule's Law! Joules Law is a way of writing the
conservation of Energy. Joule's Law states the fllowing
relationships ,

2
P = i * R , and also given V = i * R

P = i * (i * R) , gives ... P = i * V

or,

2
V
P == -----
R

This can be found in any 1st year physics text book.

Those are not Laws. There is no "Watts Law".

Those are formulas based on the *definition* of electrical power.
They are not laws of nature. They are constructs invented by man.

By recognizing difference, one puts the rest of the argument in
a different perspective. The only balance/equalization two batteries
in parallel need have is that they must always be at the same voltage.
It's entirely possible (likely, even) that two batteries in parallel
will have substantially different energy capacities and energy
densities while still happily supplying the same voltage (albeit at
different charge/discharge rates).

If the original argument were valid, one could connect only identical
batteries in parallel and would continually have to try to force them
to achieve the same energy densities.

I'm also looking for programming info for a Bendix/King radio, the model
number is LMH 3142. This is a VHF high band mobile 16 channel radio.
I also need details on the required modifications to get this radio to
accept programming for frequencies below 148MHz (its current lower limit).

Anyone got any info on this radio?

115. VSWR bridge, attempt to build...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-06 00:00:00 UTC
From: malachias@godmachine.demon.co.uk
Message-ID: <35a13e11.251013@news.demon.co.uk>
Source record: 81420

Hello!

I intend to build a bridge to measure VSWR in the ranges from about 30MHz to 1.6GHz.
Currently I have an instrument here which uses a bridge to measure VSWR, but it's use in the highr frequecy regions and it's calibration is difficult, to put in clearer words - it's a nightmare.
The current bridge is made with a Germanium Diode detector with combined with old fashioned discrete components (arrghh). It uses a RF rectification and feedback circuit for the ALC in the Signal Generator.
I would like to get rid of this levelling voltage and re-design the bridge with modern components. Actually I would like to re-design the whole unit, and put a micro in it to facilitate the calibration, however I have no time right now to do this and would like to use a new bridge with the old unit.

I began to experiment with a new design and used RF capable thin-film precision 50 Ohm resistors and tried some hp Si-Schottky Diodes (leaded). However I did not manage to get hold of real low barrier or mixer types yet. Momentarily I only have a 5082-2800.

The bridge in the portable unit is driven with a level of +13dBm (1V) which I consider as far too high for my Si- Diode version, and the new bridge should also run at a significantly lower level.
The old as well as the new bridge are designed to have the detector inside it so there is no RF-bridge output, only a DC port.
Also I aim for a very straight forward and repeatable design which does not make use of ferrites, baluns, etc.

I made some measurements on both of them, however my theoretical knowledge is not sufficient to explain what I see...

I tested both, the old and the new bridge with a signal generator and plotted the DC output voltage over the frequency with a load of constant VSWR 2:1. (I verified that this 2:1 load was flat within the frequency range of interest (becoming inductive with frequency) with a calibrated NWA.)

A 50 Ohm load gives next to 0.00V DC output which is what one would expect.

With the 2:1 match on a calibrated and leveled signal generator, the output of the DC port was measured. One should assume to see that the output voltage is flat over the frequency but it was only relatively flat up to about 120 MHz. After this is peaked up significantly in the

range from 200MHz to 1 GHz. Other loads show a different characteristic.

An open or short circuit shows very different behaviour, both with a sharp roll off from about 700 MHz which would make it unuseable at 1GHz+.

My results so far are that the Si-Schottky Dioded gives me significantly more output voltage than the obsolete and unavailable Germanium type. Hence it was possible to operate the new bridge at a lots lower RF level than the +13dBm consumed by the Germanium type.

Since I am a bit new to measurment instruments, what is the secret to flatten this response characteristic of the detector? from the mechanical point of view, I have tried to make the design as easily producable as possible, of course having a close eye on the RF layout. Since I haven't design the unit with the Germanium bridge, I have no idea what the measurement strategy is. I believe there is a bit of a struggle to incorporate the frequency response of the detector to that of a required DC voltage which is proportional to the reflection factor.
Now, I have no idea on how the detector circuit itself behaves over the desired frequency range. Since I have no means of simulation, I would like to know how professional units respond. Also the diode I-V characteristics need to be taken into account. On low levels, the diode is operated in it's square law region which will also have an effect of a distorted measurement. On the high level version, one can't really predict what's happening because the general frequency response is not linear at all. Also parasitic effects will contribute to this behaviour.

(I do have Rhode & Schwarz Bridge here but this has no detector output and uses ferrites to tweak it. I find that this is not the right way for my development. I will not use it to check out it's reponse.)

Amateur publications I found do not mention details of detector arrangements and response characteristics. So ti will be difficult if one intends to calibrate it over a wide bandwidth instead of some spot frequencies. this will be easier when used witha micro.

My questions: has anybody got experience with VHF to SHF wideband bridges? Does anybody know how to do it properly, what diodes to use, how to make it repeatable? How to flatten the charactersitics in oder to give it a wide band cal (like for an analogue meter?)

73 and Thank you, all ideas appreciated

Well, Allen, I think it was the academics who done it, not the FCC --
but Ohm's Law has indeed been redone.

Used-to-was, resistance was a property of some objects to inhibit the
flow of electricity. And you got its numerical value by placing a
voltage across the object and measuring the current through it. The
resistance was then R = E/I.

Well, now we have objects that have negative resistance. Ohm would
be spinning in his grave. ;-)

Thanks, but the surfaces involved aren't accessible (except to squirt some grease or solvent into with a syringe). They're some ball bearings running in a cage.

Thanks, everyone, for the suggestions. I'll try some wheel bearing grease first and see how that works out.

>Roy Lewallen, W7EL

Well I guess maybe this might not be workable, or somebody would have mentioned
it by now, but what about running a flexible jumper straight to the shaft and
bypassing the connection through the bearing alltogether? Might that work?

How bout a homemade wiper contact for the shaft, using a contact from a relay
or something?

Some varieties of never-seize ttype greases have a large amount of copper and
molybdenum. We got some goop on my ship that is loaded with copper, and might
work. I'll check the resistance of it when I go back to work, and if it looks
like it would work I'll snail mail you the particulars at ur callbook
address... or maybe just mail you a little bit of in a ziploc or something.

Source record: 81431

Actually, as others have pointed out here, sealed lead acid batteries
and gel-cells are not the same thing at all. They each have unique
charging and usage properties.

Tech America shows a 12-v, 4 AH sealed lead acid battery for $26.99. You
can get 7 AH for only $3 more at $29.99. Next step up is to 16 AH at
$69.99 or 32 AH at $99.99. The 1.75" dimension that "j harris" wants is
not available in this line of batteries.

Thanks Carl for your reply.

Yes, that's what I meant. But some IC's are OK, because you will need to
have some gain. Space would not be the mayor problem, Although I would not
like to use the L's.
The biggest problem I stumbled on, is the response time, which must be
rather quick, or you will loose the first part of the transmission. I am
very surprised that some mechenical devides also exsist, I wonder what
there response is.

I have the circuit diagram of a transmitter that uses a TTL chip plus a PA (with a couple of other components). Worked fine with 5 watts output and small enough to fit in a matchbox (3 x 2.5 x 1, without heatsink). The circuit is on the net, the URL of the project is:

http://user.tninet.se/~acz732k/tx/5watttx.htm

Best regards Harry, SM0VPO

Hi all,

My trusty Yaesu IC260A is sick and in need of some attention. By trial and error I have found out what some of the pot's do, but what I would really like to have is the manual for the rig. Has anyone got one they could copy and send to me. I will make good postal expenses etc.

Harry, SM0VPO

133. PC Board Fabrication Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-06 00:00:00 UTC

Does anyone have names of companies that produce PC boards (professionally) in small quantity? I need to make several PC boards in 25 to 100 lot for some projects. The owner of the company I have been dealing with for the past 15 years is closing shop.

The boards I need to make are typically 1, and on occasion 2 sided. Max size is 3 x 5", and with standard green Fiberglas. I send x2 artwork on a transparency, with hole drilling info. Boards need to be etched, cleaned, solder/tinned, and drilled. I can supply copper board if necessary.

If you know of a company that does this kind of work, please E-mail me at w8hdu35@wcoil.com and REMOVE the 35 from the E-Mail address. (Sorry about the extra work, but the spammers send me too much crap already).

>Any hope of
>converting these to ten?

Hi Bill:
I've done quite a few conversions over the years. Although I don't know the model number of the particular Regency you have, most are not worth the effort due to the type of PLL circuit. The best conversions are the older PLL circuits on the Undien chassis using the 858 chip. Some of the Regency radio's use this chip so you might check---there are a few others but I'd have to look up my old notebook on various chips. If you want, I can do that or if you give me the model or PLL chip I can check for you. 73 Bill N4MXF@aol.com

Hi Carl:
I have the same amp and there are probably a bunch still around. A very popular set up. The 1960 ARRL handbook along with 4th (1963) and 5th addition (1970) ARRL SSB for the Radio Amateur cover the amp in detail. The latter cover the same amp but grid dirven. I built my first 2X813 amp in the mid 1960's and still run use it. It has separate amps for each band. I also use a pair of 813 modulated by a pair on AM. If I ever be of help drop me a line. 73 Bill N4MXF@aol.com

FARFest '98, the *last* Gaithersburg Hamfest, will be held
on Sunday, September 13, 1998 at the Montgomery County
Fairgrounds in Gaithersburg, Maryland.

Gates open at 6:00 am.

Take I-270 to exit 11 northwest of Washington, DC. Follow
the signs to the Fairgrounds (Montgomery County Agricultural
Center).

Talk-in on 146.955(-) MHz.

Special event station W3PRL-AM (Rock XV) on 3885 and 7290 kHz.

Admission $5. Tailgating $15. For more info, contact:

Al Brown at 301-490-3188, or
Mary Morris at 703-971-3905, or
e-mail at Amateur_Radio@hotmail.com

In 1999, FARFest is moving to Bowie, Maryland.

supply boards for projects in the popular Amateur Radio magazines.

139. Mystery Function Generator

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-06 00:00:00 UTC
From: Norm Melick <henmel@postoffice.worldnet.att.net>
Message-ID: <6nr11n$4f2@bgtnsc02.worldnet.att.net>
Source record: 81502

I have a "mystery" function generator that I picked up at the Livermore, CA swap meet. I was told that this might have been part of a club project, possibly from a design in QST.

Front panel:

It has three BNC connectors, running vertical. They are labeled, from top to bottom, SIG, SWP, CNTR.

Next, it has two pots, labeled FINE and COURSE. Above these two knobs, is the label FREQUENCY.

Next to these pots is a rotary switch labeled ATTENUATOR, with the positions labeled as .001, .01. .1 and 1.0.

Then I have two switches. One switch is labeled SWP on the top, and CW on the bottom. The other switch is labeled ON and OFF, with an LED power light below the ON/OFF switch.

The back panel has a pot connected to the SWP and CNTR BNC connectors, and a fuse for the 110V line.

The circuit board has an ICL8038 14 pin function generator IC, an LM555 8 pin timer IC, an LM741CN 8 pin Freq. comparator, and a LM340T12 +12V voltage regulator and a 7912C -12V voltage regulator in TO-220 cases.

There are two places that have three pins, arranged in the form of a small triangle, that transistors could be inserted into. Each triangle is next to a trim pot, which looks like it is used to control the voltage on these "transistors". These "transistors" have been removed.

The bottom of the board is labeled "SRD LABS, ASSY NO 1732-98, PART NO 1632-98.

This project is clean and very well built. I know this is tough, but out of respect for the builder, I'd like to replace the missing parts, and get this project running again.

Any help would be greatly appreciated.

>right is drawing 2 charging amps. When you get through you will,
>according to Watts Law, have put 14 watts of power into one battery and
>28 watts into the other.

"Watts Law"? Does that have something to do with steam engines? :-)

What you store in a battery is Joules (energy), not Watts (power).
Power is the rate of doing work, it isn't something which can be stored.
Energy is the ability to do work, it can be stored in a battery. The relationship
between energy and power is

E = P*t

where E is energy is joules, P is power in watts, and t is the time over which
the energy is delivered in seconds.

So if the above charging scenario were to persist for one hour, one battery
would have 50,400 joules stored in it and the other battery would have 100,800
joules stored in it. The joule is a rather small unit, so we commonly use a larger
unit where t is one hour rather than one second. This unit has a hypenated name,
it is called the watt-hour. So one battery has stored 14 watt-hours while the other
has stored 28 watt-hours.

Now since we assume a constant voltage, we can factor that out and use units
of amp-hours instead of watt-hours. This is the normal unit of nameplate capacity
for batteries. In that case, one battery has stored 1 amp-hour while the other has
stored 2 amp-hours.

If we have two batteries, each of which has a nameplate capacity of 100 amp-hours,
and are accepting 1 amp-hour and 2 amp-hour respectively, after 50 hours, one
battery will have reached capacity and cannot accept any more charge. But the
other battery is only at half capacity and can continue to accept charge for another
50 hours, after which it too will be at full capacity and will no longer accept charge.
At that point, we will have stored 200 amp-hours in the batteries.

>Obviously, the battery on the right got more power than the one on the
>left. This can be equalized by charging the battery on the right for a
>while and then exchanging it with the battery on the left so the left
>battery can get its share of power!

How will swapping the physical positions of batteries wired in parallel
change the rate at which they accept energy?

>This is why I think Kirchhoff's Law should be included in the Tech +
>license examination. Nobody cares whether you connect your batteries in
>parallel or series, it's how you charge them that counts!

:-) :-) :-)

Kirchhoff's Law says that the vector sum of currents at a node is zero.
Or put another way, the current into a node is equal to the current out
of a node.

This says that in a single loop mesh, the current is everywhere the same.
So two batteries in series will receive exactly the same amount of current,
and hence the same charge over a period of time. The amount of current
in the mesh will be

I = E/(Z1+Z2)

where Z1 and Z2 are the impedances of the two batteries.

If a mesh splits into two parallel paths, the currents into and out of the nodes
terminating the paralleled meshes is zero. The currents through the two parallel
paths will divide in inverse proportion to the impedances of the two paths. Total
current is

I = (E*(Z1 + Z2))/(Z1*Z2)

and the current through each branch is

I1 = I*Z2/Z1 and I2 = I*Z1/Z2

Now this is all very simple, but it turns out that the effective Z of a battery
depends on its state of charge. The more charge the battery holds, the
higher its effective Z becomes.

To find out the charging current at any time t, we must appeal to the calculus
and solve a differential function of Z with respect to t. To find out the amount
of charge accumulated by each battery at a time t, we must evaluate definite
integrals of I1 and I2 with respect to t. Due to the inadequacies of ASCII for
mathematical notation, I'll leave the expression of these functions as an exercise
for the student.

But by inspection, we can draw a couple of qualitative conclusions about
batteries charged in series and in parallel. Given sufficient time, batteries
charged in parallel will become equally charged. Batteries in series will
only acquire the charge of the battery with the lower unfilled capacity. In
other words, once the least discharged battery is charged, no more charging
current flows in the series mesh, and the other battery remains only partially
charged. So the practical consequence of all this is that you want to charge
batteries in parallel, not in series. If you must charge batteries in series,
you want them to start with equal unfilled capacity and have matching Z.
That's why you want to replace series connected packs with all new cells
rather than just replacing the dead cells.

>service/hobby that ideally will pay for itself than a primary business.

There is a movement to start a new service of local FM
low power broadcasting, which is more to a kin of the way
low power educational stations were in the 60s and 70s. The
facilities are likly going to be in the 10-50 watt range
with an antenna 100-200 feet aat.

As far as getting a Class A station, forget it. You do
not have the money, and anyone who suggests that a normal
person start a legal station does not know the broadcasting
business. At the minimum you are looking at $100,000 or
more after you fight off/pay off people who will file
against you for various reasons, and then you are looking at
4+ years till you will see a grant.

Having been down this road many times by myself and
various clients, I can tell you that unless you have a rich
family member that just passed, or you have some investment
cash just laying around, I don't think it's a worth
persuing. I don't mean to burst your bubble, but the
reality of starting a station in that manor is not
realistic.

If you get a station, you can make enough to survive on
and then some. Especially if the station is more than a
juke box and offers something to the community. Of the hams
I know that are involved in broadcast ownership, they all do
very well. The equipment is not a problem in gathering,
only the things such as a reliable traffic/AR system, and a
decent automation that manages inventory yet allows you the
freedom to program decently.

If you do get a station, bond with your hams in the
area, and work up a relationship with Skywarn folks. At
some locations where these bonds have been made, and there
are hams at the station which are familiar with the lingo,
their reporting of weather emergencies leads the E.A.S.
system by 5-7 minutes, easy.

When people find out that your station is the leader in
weather reporting, you will not have any trouble with public
relations. <grin>

In the interim, you might want to work with the local
cable to program music and news on the public access
channel, or think about working out a deal with an FM
stations SCA or TV SAP channel. Here at our station, the
SAP is popular because we have World Radio Network on it. I
use WireReady to automate it, and it's 24 hours a day with
no operator intervention. Just two of us hams program the
thing and keep the liners current.

I don't want to add confusion to Gary's excellent explanation. But it should be mentioned that the final statement, quoted above, applies only to lead-acid batteries. I believe the original poster stated that this was the battery system being discussed, but wouldn't want a latecomer to the thread to try applying this policy to NiCd or NiMH batteries. While lead-acid batteries are charged with a constant voltage, NiCd and NiMH are charged with a constant current. Therefore, they should be charged in series rather than parallel, so that all cells get the same amount of charge regardless of the individual cell voltages.

If two lead-acid batteries of different states of charge or different capacities are charged in parallel (as they should be), the one requiring the most charge will draw the most current. Eventually they'll balance out as both become fully charged. That is, when you apply a constant voltage to a lead-acid battery, the amount of current it draws decreases at it becomes more fully charged. NiCd and NiMH batteries don't behave this way at all. They must be charged with a constant current and so must be connected in series to charge.

Roy, try the CoolAmp and a buffing brush on a Dremmel
so the surface is clean and smooth. It should help a lot.
I had to do this on some of my rotary inductors on my 80
meter antenna system which started to get intermittent due
to age and corrosion.

At our site, which is a TV station with a 500 foot
tower, a lightning strike on the tower seldom has done any
transmitter damage. What has happened is that long serial
computer lines in the building usually toast the computers
they are connected to. The man across the street has lost
just about every type of appliance since the tower was
installed in 1963.

The problem is not the lightning, but the EMF/Magnetic
field which is produced when the tower is struck. To prove
this, we make a dipole about 400 feel long with a 100 ohm, 2
watt resistor at the feed point. After the storm the dipole
was lowered, and the resistor was gone.

Lightning is tricky, and preventing damage is a guess
at best.

Also any of the newer designs based on the 8719 PLL.
Most have a loop mixer crystal of 11.3258Mhz. For
ever .150 Mhz you raise the crystal freq you raise the
operating freq .450 Mhz, or a 40 channel span on the dial.
In addition the MB8719 can be set up to cover 128 channels.
Normally these are on 10 Khz boundries. However you can make it
do 5Khz boundries as well, but this is normally not done. A good
radio to look for is the Uniden Grant XL, The Cobra 148GTL, the
Uniden President Washington, old or new model, it does not matter.

Jukebox? Not me! I definitelly want to avoid any of the big formats. Music will probly be only about 1/4 or 1/3 of programming, and definitely not the top pop crap shoveled out by the megabuckers. I figured more locally oriented entertainment, news and features aimed at the local English and to a lesser degree Spanish speaking communities, as well as all the yankees that invade every winter. I figured on a lot of "reporter on the spot, checking out the new restaurant or night spot" kind of thing, what's REALLY happening at city hall or the cop shop, who's hiring, housing markets. call-in shows, including at least one by and for high school or younger kids, etc, and certainly the best weather and disaster info I can put out. Music will mostly be in the form of "programs", and not a steady backdrop. Maybe even some live shows... nobody does that anymore, very much. I can't stand all the plastic, sanitized crap on the radio these days, nor do I care much for the Howard Stern school of modern radiojournalism.

I guess I'm talking pretty big, since my next question is What is AR? sounds like something I need, but I don't know what it is. Also I figured I would be recording a lot of stuff onto reel to reel for pre-recorded shows, and a pair of programmable CD changers for most of the "store-bought" music programs. How much automation is practical, do you think, in light of the kind of programming I would like to try, and how do I accomplish it?

>

Excellent Idea. That should really help sew up a local market. If I can one-up "Lying Larry", one of our local weathermen whose real name shall go unsaid, I might even pull a few at home tv viewers away from the toob!

>

I know what SCA is, but is SAP just a similar thingie on a TV subcarrier? Is WireReady a program for handling audio feeds like that? What kind of programming do you get for your station through this medium? And... am I correct in assuming that a liner is stuff in the breaks like commercials, station ID, brief announcements, etc?

>Fred

What if any difficulties did you face in starting up your station, and how is your situation probably similar or dissimilar to mine?

Thanks for the nice post, Fred. I sure am getting a lot of info here. Sorry about all the newbie questions, and thanks in advance for any you see fit to answer.

Your logic of connecting two cells in parallel is sound. Connect the positive
lead of your charger to positive and the negative to negative as you do now. You'll run twice as long, but unless you double the amperage of your charger, they'll take twice as long to recharge. There ain't no free lunch out there.

Sounds like this is classic design around the ICL8038 Function
Generator IC.

> Front panel:
>
> It has three BNC connectors, running vertical. They are labeled,
> from top to bottom, SIG, SWP, CNTR.
>

These are probably:

SIG - Signal output. Since I didn't see anything that related to
sine, square, or triangle, I would assume that this is a
sine wave output.

SWP - This could be either a sweep input or output. I suspect that
it is probably a sweep output. The ICL8038 is a voltage
controlled device and can be swept from a low frequency to
a high frequency by applying a sawtooth wave. If this sawtooth
wave is plugged into the horizontal sweep input of a scope,
you can effectivly sweep the beam based on frequency instead
of time. The LM555, mentioned below could be used to generate
the sweep function.

CNTR - Frequency Counter Output - This is probably the sine wave
output, converted to a square wave for connection to a
frequency counter. This would be useful for setting the
output frequency, but only when the sweep is set to zero.

> Next, it has two pots, labeled FINE and COURSE. Above these two
> knobs, is the label FREQUENCY.
>

These would be for setting the output frequency. COURSE for getting
close, and FINE for fine tuning.

> Next to these pots is a rotary switch labeled ATTENUATOR, with
> the positions labeled as .001, .01. .1 and 1.0.
>

This is for attenuating the output from the SIG connector.

> Then I have two switches. One switch is labeled SWP on the top,
> and CW on the bottom. The other switch is labeled ON and OFF,
> with an LED power light below the ON/OFF switch.
>

SWP/CW - This is for turning the sweep function on and off.
In the CW position (Continuous Wave) the output will
be a single frequency..

> The back panel has a pot connected to the SWP and CNTR BNC
> connectors, and a fuse for the 110V line.
>

These are probably for sweep and frequency counter output, just
like the ones on the front panel, but with and amplitude control.

> The circuit board has an ICL8038 14 pin function generator IC, an
> LM555 8 pin timer IC, an LM741CN 8 pin Freq. comparator, and a
> LM340T12 +12V voltage regulator and a 7912C -12V voltage
> regulator in TO-220 cases.
>

You can find data sheets for all of these parts by doing a search
at http://www.questlink.com. There should also be some application
notes that will help explain some of the above functions.

> There are two places that have three pins, arranged in the form
> of a small triangle, that transistors could be inserted into.
> Each triangle is next to a trim pot, which looks like it is used
> to control the voltage on these "transistors". These
> "transistors" have been removed.
>

To figure this out you would probably have to decifer the entire
circuit, and then make a guess. There are things that the circuit
absolutely need and things that it doesn't. Only with a complete
schematic can you tell for sure.

> The bottom of the board is labeled "SRD LABS, ASSY NO 1732-98,
> PART NO 1632-98.
>

> missing parts, and get this project running again.
>
> Any help would be greatly appreciated.
>
> 73/Norm
> KQ6SD
>

The name and part number is not familiar to me but you should be
able to figure it all out.

If you need further help, let me know. I have used the "8038" before.

Ed,

Although they often use different frequencies to avoid being QRM'd during school calls, MIR typically works on 145.985 for casual QSO's.

I got em' twice on 2 just using my Ringo Ranger and 50 watts. You'd be better off with some other antenna than the one on your HT. You'd be able to hear them, I would think, but there is usually a good pile-up on him when he's operating voice.

Homebrew is the only way to go, see 97.317 Standards for type acceptance of external RF power amplifiers. No commercial HF amp can be manufactured unless it requires at least 50 watts of drive. So you'll have to build your own. A tetrode in common cathode configuration is a good choice when low drive power is available. You might want to look at some of the amps recently featured in the magazines using the Svetlana power tetrodes, or dig way back for an amp using a pair of grid driven 813s.

Or you might want to build an IPA (Intermediate Power Amplifier) to go between your rig and one of the available commercial amps. If you arrange the switching right, you can then choose between 20 watts, 100 watts, and 1.5 kW.

BC-350a mobile scanner,

Recieves on:
29- 54mhz FM
108-137mhz AM
137-174mhz FM
406-512mhz FM

This little guy has ootles of built on search freqs for
you to find those new and local freqs fast. Great for those who
don't know what the police are using.
Dosen't do trucked, dosen't do 800mhz, and dosen't do
cell, but it's still a great little thing to start out with.
Has 50 user selectable memories in three banks plus 100
pre programmed freqs in 5 banks that are built into the rom.
"Private" bank holds 20 user selectable freqs, "Police" bank
holds 20 user selectable freqs and has a bunch of pre-set freqs
that can be locked out, "Fire/Emg" bank holds 10 user selectable
freqs and has has a bunch of pre-set freqs that can be locked
out, "WX" bank does all weather freqs, and "Air" scans the entire
aero band.
Unit uses a mounting bracket, which was lost by the
previous owner. Not included. No manual, but I can instruct on
how to program it. Runs off of 12v DC, power supply not included,
but power cable for opertaion in the car is.
Basically, just the unit itself and the power cable for
car operation. But it'd be a great little thing to keep out in
the car or truck.

It works just fine and has no problems.

Asking $45 plus shipping, or best offer.

I'm selling because I'm currently between jobs and don't
use this at all anymore. I picked it up to put it in my car, but
never got around to doing it. I need the money more than I need
the hobby.

Remove the second, anti-spamming N from the
end of tdragon in my address to respond,

I've done this in the past with mixed success. It's definitely desirable to prevent tank current from flowing through the drive, and putting a wiper on the shaft or soldering a flexible wire to it sometimes helps. Unfortunately, though, the current divides according to the impedances of the paths. The path through the shaft usually has low impedance so it's really difficult to divert the majority of current away from it. The best way from an electrical standpoint is to insulate the capacitor shaft from the front panel altogether, but this complicates things mechanically, especially in compact rigs.

In the rig in question, I'd have to do some really major disassembly to get at the capacitor. If I got that far, I'd just replace the drive. The lesson in all this for me is to design the rig so the drive can be replaced without major surgery. And to resist modifying the rig in a way that buries it more deeply.

If you can make the drive, try Debco in Cincinnati.

Before that, check their web page at www.debco.com.

Well, sort of.

The above formulas concern Power, which is the time rate of change
of energy.

I believe Joule's original finding was indeed conservation of
energy. He found that the amount of heat (energy, measured as the
temperature rise of an object) produced by an electric current was
proportional to the product of the current, the voltage, and the
time.

Anyway, this thread is drifting away from the original topic, which
I think had to do with charging batteries in parallel. Gary Coffman's
explanation covers that issue nicely.

176. Morse Code input to Palm Pilot? [Was: HELP! How do I WRITE at 25+ wpm?]

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-08 00:00:00 UTC
From: John Mock <kd6pag@h207-21-75-37.theos-software.com>
Message-ID: <877m1nkemi.fsf_-_@TVR-LINUX.THEOS-Software.Com>
Source record: 81370
Cross-posted to: rec.radio.amateur.equipment,comp.sys.palmtops.pilot,rec.radio.amateur.homebrew

I recently got a 3Com Palm Pilot, and have been trying to learn to using it handwriting input pad. It seems tediously slow to me, although i've been told that will improve with practice. Then, i came across this discussion about the problems of trying to write down Morse Code (CW) as quickly as one can understand it by ear:

However, if you intend to QSO above 20 wpm you will be well served to learn how to head copy, the sooner the better. CW went from being a chore to a real pleasure once I put down the pen (yes, pens do write faster than pencils, btw) and started really listening, relaxing, and engaging in a conversation. The absence of having to write everything down left my mind more time for listening to what is being said, also.

-- Casey Bahr <casey.bahr@intel.com>

the best i could ever do was abt 27 wpm by pen could copy 30 -32 solid by ear and 35 pushing

so to write at 25wpm u must not be pushing 25wpm , should be able to copy faster than 25 to be able to write 25.

i found 27 was my limit no matter what. My hand couldn't move any faster.
-- Anonymous

The question that occurs to me is whether i could learn to send Morse Code (CW) faster than Palm Pilot hardwritten input. The device is already touch sensitive, so it may not even need any special hardware.

1) Am i likely to have either a speed or accuracy advantage using Morse Code over computer-recognized handwritten input?

2) Is it likely that i can program a Palm Pilot use Morse Code as an input mechanism?

3) Has anyone looked at this question? Or can offer sample code for reading the Pilot touchpad and/or doing things in real-time?

Source record: 81452
Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.homebrew,rec.radio.swap

I have a pair of boards pulled from medical gear that I had thoughts of building into an HF amp. That project is not coming together and I need the cash more than daydreams on the shelf! The boards are labeled: Technicare 600 watt amp. They have been tested by the fellow I acquired them from at 450 watts (each board) key down for a few moments (they need much larger heat sinls and a couple of resistors upgraded before they may sustain that sort of power).

I have gathered information as to sources of splitter-combiners and output filters which will work if one chose to combine two of these for a full power+ HF amp.

I also have a full set of replacement finals (Acrian S200-50).

Asking $425. shipped conus for the pair of boards and the four replacement finals.

185. Mighty Midget Update

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-08 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <35a381b0.86036771@news.erols.com>
Source record: 81458

I put the Mighty Midget RD into the old Heathkit Sixer cabinet. Looks great but I found that the cabinet seriously detuned my BFO. I had to put a hole in the top of the box so that could acccess the BFO's slug-tuned coil. I used a slightly widened plastic nut starter to do the tuning. Worked great. SSB sounds FB!

Rigged up a 3PDT relay box to handle TR switchover with the DX60B. Works fine, but I had planned on muting the RX by simply lifting the cathode of the RF AMP off ground on transmit (actually the ground side of the RF gain control). This succeeeds in turning the RF gain way down, but it does not silence the RX. How about just lifting the cathode of the AF amp off ground at the same time? Any other suggestions for muting?

Possible future improvements:

-- Of course the filter. But I'm really tempted to leave it as is (455 kc transformers only - a bit broad). Anyone have experience using ceramic resonators as filters at 455 kc?

-- Tuning mechanism. A 6-1 reduction drive would make tuning easier, but I don't have one in my junkbox (hint! hint!) and the current arrangement (direct tuning of cap) is OK.

> design one of these for a particular frequency range?

There is discussion of this in _Amateur Radio Techniques_ (RSGB),
among other places.

Briefly, you need to choose network pole frequencies throughout
the frequency range of interest. The component values for each
stage of the network are then related to the pole frequencies by
f = 1 / (2 pi r c). The phase shift is theoretically exactly
90 degrees at each pole frequency, and close to it between them.

How you assign pole frequencies is up to you (there was an article
in QEX about it), but by assigning them in the same ratios as
preferred value components, you can design a network that only
uses preferred value components.

>

There are segments for each of these bands set aside for weak-signal work
(usually done on CW/SSB) and satellite work.

I am "active" on both the 5760 and 10368 MHz weak-signal bands (if you
could call it "active" as there isn't anyone else in my immediate area on
the bands, and I have been trying for some rainscatter QSO's for greater
distances).

But including all the activities we would/could do on these bands, I
doubt if we'd need more than 100-MHz segments unless a LOT of people get
busy and get active up there.

SHF Microwave Parts (www.shfmicro.com) has some neat Gunnplexers and
antennas that aren't too expensive and can get you on 10 or 24 GHz
without too much effort on FM. Anyone with an HT could do it!

Down East Microwave (www.downeastmicrowave.com) has lots of neat stuff
for all the UHF/microwave bands.

Note, this isn't an advertisement, but rather an attempt to get some more
people going on these bands. Steve at DEM is immensely helpful and I
have purchased most of my microwave stuff from him, and at one time from
Norm at Microwave Components of Michigan, which seems now to be defunct. :-(

I like these running commentaries about people's projects.

I thought you'd said before that you'd found some items for use as filters. Did those not work out? If I recall you'd found a mechanical filter, which surely would be the best choice, even if it is a bit wider than you'd hope for.

I was going to suggest earlier ceramic filters. Most car radios you'll find these days (along with a lot of other radios) have ceramic filters for the selectivity. You can get them cheap (or even free, like the two I found in the garbage last week). They would probably be wider than optimum for amateur use, but they would have a sharper skirt than just an IF transformer. One thing that I've not really seen anything about is cascading these lower cost ceramic filters. Perhaps an area for exploring. Could you couple some up with just capacitors (like you'd see in the old days done with IF transformers to give better skirt selectivity), or would it be best to spread them out through the IF? I'm sure the latter is best, but more difficult to experiment with.

You can get those ceramic filters fairly easily (and locally) from old radios, and you can get them cheap, Since they are actual filters, you're ahead of ceramic resonators.

An even better choice would be to find some junk CB sets of reasonably recent origin. They too would have ceramic filters in the IF, and they would be narrower than those in broadcast receivers. They are less common, but I once did find a pair in the garbage, and I've bought junk CB sets at hamfests for a dollar or so.

The filters for AM that I've seen tend to be green or orange, and usually a square (but sometimes a thin rectangle). They usually are marked with the IF (sometimes they are 450KHz, sometimes 455KHz), though the actual

bandwidth isn't marked (they are coded, so if you can find the manufacturer's data, you can trace bandwidth that way). Be sure to trace out the circuit before removing the filter, so you know the pinouts and the input/output impedance (often there are loading resistors) and usually there are associated capacitors.

If the tuning capacitor that you are using is nothing special (ie it's not built like a tank and meant for oscillator purposes) you might look into using a variable cap from an old radio. A number that I've pulled out of portable radios (the hand held kind rather than the pocket size) include a reduction gear. It's not a major reduction, but it's better than nothing. But I'm sure they aren't worth using if you have a better capacitor in place already.

You might consider adding a fine tuning capacitor. Find a small cap, put a good knob on it, and put it in parallel with your variable oscillator tuning cap. It too is not as good qs a reduction gear, but there is nothing worse than constantly tuning just past the signal you want, and a fine tuning knob would save some of that back and forth tuning to get the station just right.

> Code over computer-recognized handwritten input?

No. The reason is that in order to achieve those high speeds (over 20 wpm) most people have to use finely balanced and tuned morse code keys. Oldtimers use a vibra-key and younger people (like me) use electronic keyers to get anywhere near 30wpm sending morse code. Trying to tap on the palm display with a pen just won't cut it. Also, you'll probably eventually wreck the display.

> 2) Is it likely that i can program a Palm Pilot use Morse Code as an
> input mechanism?

I don't know about your programming skill level, but writing code for the pilot to decipher morse code is fairly straightforward and not very difficult.

> 3) Has anyone looked at this question? Or can offer sample code for
> reading the Pilot touchpad and/or doing things in real-time?

I was actually thinking of writing a program for decoding morse code and displaying the results on the screen. I envisioned it being useful only as a training tool and not as a speedy way to enter text. If you look around, such a program may already exist. If you're having trouble with grafitti, just use the on-screen keyboard.

Sorry if this is a bit off topic, but I'd like to know if anyone can point me to a source of surplus electrical equipment. What I am looking for is a DPDT power transfer switch rated at 100 Amps or higher (something that would allow switching between a commercial power source and a generator, for example). New ones cost around $500 and I have to think there must be someplace that sells these used/surplus at a *much* lower cost (I only need one). I figure if anyone would know of a source, you folks might.

Thanks in advance for any pointers. To send me reply e-mail, please make the obvious modification to my e-mail address.

Hi,

I need to make closeup color photos of my QRP-L and Homebrew projects.
What to see small construction details and small parts well focused.
Also need to make photos showing Scope waveforms.

What digital cameras are you folks successfully using that
can do both normal people places photos and also
make scope and pcboard photo?

I just bought used and returned a Vivitar ViviCam 3000 camera.
On sale for $200 at FRY's Los Angeles.
Absolutely unable to focus shorter than 4 feet
from object. Scope waveforms bloomed pure white hiding all details.

Thanks for any hints, brand names, models, discount stores that sell best
deals.

Try taking an ordinary photo but use a scanner. A scanner will give you
better quality. However you will sacrifice memory space for quality. You
can usually get decent quality for under 1 Meg depending on the size of your
picture.

Good Luck
TPM

This might not be what you are after, but if you don't need an automatic transfer switch, Square D and many of the other electrical suppliers make a disconnect that has a center off position, up is one power source, down the other. This is a disconnect that you might see ahead of a motor, pump, compressor, etc. with the exception of the special features. I don't know how much they cost, but I can't feature them costing $500 even new.

Louis

I would stick with regular film photography for now, especially if you already have photography gear. Flatbed medium resolution scanners are getting cheaper faster than the digi-cams, and as a bonus you can use it for faxing, copying with your printer, scanning documents and extracting text via OCR software, etc. You should be able to find a 300 dpi color machine for around a hundred bucks now. I think I paid $109 for the one I use. It's pretty slow, but speed is only a problem in an office, usually. Mine is an easyphoto Imagewave, I bought it from an aol spammer online, and it works well enought that I figure I got a decent deal. Came with a bunch of software too. It does a great job on photos especially at the 300 dpi level. I can do a fair bit of enlarging before it starts to look crappy, especially with a good sharp foto. I can't get it to scan in black and white mode though, and the packaged OCR software only works with black and white images.

While it would be not much of a problem to build the required unit an aircraft's transponder responds to an interegation signal. It would be alright to receive it if a radar station "pinged" it, it would be illegal for you to send such a signal.

While you can't build a device to directly ping aircraft transponders,
you might be able to build a system that can read the response. This
would be quite difficult however. The intracracies of building a
bistatic radar are probably beyond the home builder.

The easiest way to build a home radar is with a gunnplexer. A fairly
easy to build FMCW radar is possible with just a few components. I'm not
sure what your intended application is, but this might be good enough.

Hi,

Just a few cents concerning this. There is an application called
TaleLight (v1.2) by Daniel McCarty, freeware. I'm not really sure about the
availability of the source, but he's left his details in his "About" page
as
danielmccarty@compuserve.com
http://members.aol.com/gmayhak/tcl/light.htm

Also, what if the various buttons were used for entering CW instead?

Hope this helps.

regards,
Rostov

Try some of the building demolition places in your area (or nearby large city). DON'T count on an accurate answer to a telephone inquiry. Most of these companies have warehouses of stuff removed from old buildings, homes, factories before tearing the place down. Quite often, prices are flexible/negotiable. - Bill H.

Tnx to K3HRN, WB6WCW and others

So far I have collected the following information on R-4C, if you have
more notes, please send an email og post to the NG.

Designers (according to LA8LF - former R.L.Drake representative) for the
2-B, 2-C, R-4, T-4, TR-4 etc models were Milt Sullivan and Ray Michel
---
* R-4C ser no above 16121 (May 73: circuit diagram 517316151):

Mixers: V2= V6= 6HS6, V4=6BA6. First (V2) and 3rd mixers (V4)
cathode injected. Second mixer is a dual gate MOSFET SFC4982.
The IF chain following the first crystal filter is V3=6BZ6 1st IF,
Noise blanker and then 2nd mixer.
4 position filter select (AM, SSB, CW1 and CW2).
---
* S/N above # 18,726 (Circuit diagram ?????18726)
Revision date - ?? 1974??
Mixer1, mixer3 pre-mixer: V2=V4=V6=6HS6, Mixer 2: V3=6BE6(?)
??-position mode xtal filter select

* S/N above 21000 (circuit diagram 11017421000) mine is s/n 22074
Revision date - Nov 1974, most articles for modifications refers to
this version:

1st mixer V2=EF184/6EJ7, 2nd mixer V3=6BE6, 3rd mixer V4=
6EJ7/EF184*,
Pre-mixer V6=6EJ7. 1st and 3rd mixers grid injected.
5 position crystal filter selection

Note: *) Philips EF184 has lower noise than Sylvania 6EJ7 for 3rd mixer
See 73' article for improving injection of 3rd mixer.

* R4C ser no above 25900
Revision date - Jan 1976

Mixer tubes V2= V4= V6=6EJ7/EF184. First and 3rd mixers grid
injected.
Second mixer is a 6BE6/EK90 with a JFET (2N5950) buffer.
5 position crystal filter selection. T7C IF transformer.
Very little electronic difference to the above model except a 125v
zener diode at the junction of R12 and R13 (regulated B+ to the
'plate' of the 6BE6 mixer).

This could be the latest model in the series before production was
halted. From the schematic, the differences between this model and
the 21000 previous is little.

Amongst the 4 series known, Drake spent considerable effort changing the mixers with particular interest in the IF chain following the 1st crystal filter. While no direct measurements have been taken, there appears to be little operational difference between the first in this list and the latter other than the extra filter position and the tapped T7C IF transformer.

As can be expected, it is considered that the later model is superior to the early model. There is a natural tendency to want to believe that this is true, but practical application does not seem to back this up.
One of the attractions for some enthusiasts is the vaccuum tube processing of the RF signal in the belief that the early model dual gate MOSFET is automatically inferior. The fact that all models in the later series have an JFET in the RF chain is somehow strangely irrelevant to this position.

S/N 25900-up, they reverted back to metal gears in the VFO as used in the earlier A and B-series. Metal gears make a great improvement in back-lash.

220. Russian Homemade 40Watt Thermoelectric Generator

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-10 00:00:00 UTC
From: David L Pearce <dlpearce@eos.ncsu.edu>
Message-ID: <35A693B2.35F34F50@eos.ncsu.edu>
Source record: 81319

I was made aware about 8 years ago of a thermoelectric generator design used in Siberia for amateur radio operators and listeners during the early 40's, etc. It supposedly could put out 40 Watts. I have long ago lost the book it was in (it was a legitimate technology manual for a high school technology course). It used a kerosene lamp as its power source, and the core was a "crown" of what may have been copper and iron wire, with every other junction in the flame, and the others out for the cool side. I would like to duplicate such a device for myself, however, I'm not sure of the wire type or the number of junctions I should shoot for at the baseline. If anyone else has information on the unit, email me or leave a message here for the group to see.

Thanks,

David Pearce - KF4MOK

For Sale:

Matched set of four matched new panel meters - ideal for the homebrew builder. These are high quality LFE/API taut band meters I got for an amplifier project I never built.

(Filament) 0-10 volts AC
(Control Grid) 0-50 ma DC
(Screen Grid) 0-100 ma DC
(High Voltage) 0-8 Kilovolts DC (1 ma movement - requires 8 megohm multiplier)

They are not marked with "Filament", etc. - this is what I intended to use them for. I never got a plate current meter.

These panel meters are modern rectangular - 2-3/4" wide by 2-3/8" high - and mount in a 2-1/8" to 2-1/4" round meter hole.

I would like to sell only as a set for $25.00 plus shipping from 44134.

Hey Art,

What memories this brings back!

I remember reading all the Alfred P Morgan books... I have a couple still. I still recall building the crystal sets with the sliders over the coils for tuning, etc. I must say that the Morgan books gave me my start in electronics. While they were already obsolete, I still enjoied them. (I'm 34 now.)

The Boy Electrician I think was my all time favorite, and I still have a copy. I've tried to get the Boy's First - Third books, but they are long out of print. I did manage to get a copy of the forth book several years ago.

Good luck in your search, and should you find any extras, I'd sure like to know.

Hi,

I would recommend the book: "Radar System Engineering" by Louis N.
Ridenour (1946, 1964) (This book is available from me). This is a very
good description of the radar systems at that time. Both theoretical
aspects and pure technical descriptions are covered in depth. A lot of
schematics of all part in radar units, with various valve types
(mostly readily available today) and other components values.
E-mail me if you are interested or visit my homepage for more
information.

Best regards,

Arnold Goksoyr

Hi Chris,

I have many ARRL Radioamateur's Handbook in stock from the period
1950 - 1965. You will usually find schematics of linear 811A amps in
these. Either a 200 Watt single valve amp, or a cathodedriven 1KWatt
with 4 valves in parallell.
E-mail me if your want such a book, or visit my homepage for more
information.

I'm interested in a sealed lead acid battery, but how good could a three year old battery be. Would you please expand and explain your "load tested good" comment.

Thanks, Hugh KF6HHS

233. FS: 12 Volt Gel Cell Batteries

Have about 40 used 6 and 7AH 12 VDC gel cells for sale. Also have
about 10 4AH 12 VDC cells. All load tested good. PERFECT for QRP rigs
and portable operation. I have sold hundreds of these to the QRP boy's
on the QRP mailing list and all have been very satisfied. Had a few
damaged in shipping and one came back DOA which I replaced for the
fellow free of charge but that's it. I am the service manager for an
alarm company and we change our customers batteries every 3 years as
preventive maintenance. These used cells should provide another 2 to 3
and probably longer service if used and recharged properly. Cells come
fully charged and are ready to go. They can be recharged with a simple
wall wart charger available at Radio Shack or a 1 amp automotive
charger. I guarantee against DOA.
Brands are Yuasa, Interstate, Radionics and Portalac.

4 ah cells are $8 shipped CONUS
6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

If you buy 2 of the same I will knock $3.00 off the total price.
Images of the cells can be seen at:

http://www.usol.com/~tje/yuasa6.jpg Yuasa 6ah

I recently purchased three of these batteries and cycled them several times to test the capacity. They were charged to 14.7-15.0 volts until the current dropped to <C/100 (except for one battery, which wouldn't drop below 200 mA -- C/20), then discharged at a constant 1 ampere rate to 10.4 volts. The expected capacity was adjusted for the rate of discharge. That is, a new "4 Ah" battery should give about 3 Ah at that discharge rate; a "6 Ah" battery should give about 5, according to the Yuasa data sheets. So I considered 3 and 5 Ah to be "full capacity" for 4 and 6 Ah cells, respectively, when discharged at 1 ampere.

The best I could get out of the single 6 Ah battery I got was one hour and 15 minutes at 1 amp, or about 25% of full capacity. Of the two 4 Ah batteries, one gave 53% of full capacity and the other 86%.

After a lead-acid battery is stored, the capacity is sometimes reduced until it's cycled several times. I cycled these several times, noting the capacity change, to eliminate that possibility.

This isn't a complaint. I didn't expect new batteries and was curious about what their condition would be. The sample group is much too small, and the results too varied, to reach any conclusions about what someone else might get. Tim sent the batteries promptly as ordered, and the price was very cheap. You'll have to decide whether they represent a good value for you. My main use is for backpack portable operation, so I don't want to carry the unnecessary weight of a below-capacity battery. But you might still find them useful if weight and volume aren't a consideration. I do strongly recommend that you do a discharge test before you depend on their capacity. Don't discharge them below 10 volts, and recharge them promptly after discharging. Incidentally, this is a good practice for new batteries, too. I had a 2.2 Ah Panasonic battery that I'd used only a couple of times, and kept charged by refreshing every 6 mo. - 1 year as recommended. After a couple of years without use except for refreshing charges, I found it to be at about 30% capacity. Cycling many times increased its capacity only to about 45%.

I recall a recent posting from a person who said that the alarm company he worked for didn't replace their batteries until they'd been in service somewhat longer than 3 years. I wonder what kind of capacity they'd have left. . .

A few are out there, Ramsey Kits comes to mind, their URL is
ramseyelectronics.com.

While looking up their URL I found this cool link:

www.cestro.com/pcdealer/pcd100k.shtml

tons of kit manufacturers!

However, if you are interested mainly in getting started in packet
radio, it would be simpler and probably cheaper to pick up a TNC at a
hamfest.

I do not know if there is more than two electrical verisons of R4C but
for those who wants a receiver that lasts, go for serial numbers over
25000, not sure what exact number but around that point they reverted
back to metal gears in the VFO as used in the earlier B-series.

Metal gears makes a great differece in back-lash, trust me!

I would highly recommend avoiding all Ramsey kits, as they sell
garbage. Even when they know there's a problem with their products
they fail to add addendums or update harware.

Also, their TNC is nothing more than an overpriced comparator circuit,
better to buy a Tigertronics or BayPac TNC for the price.

My recommendation: Buy a Kantronics KPC-3 PLUS. They run around
$120 to $140 mail-order and do much more than a "software" TNC can do
-- like APRS. For HF and VHF Packet, wait a month and buy the new
Kantronics KAM '98.

You might run into troubble here. Using a direct conversion receiver means 100 dB of audio gain. Put this in close vincinety of a counter and voila you have filled the receiver with spurious signals.

Separate power supplies and lots of filtering and sheilding is mandatory.

Cheers

Transmitting on unauthorized frequencies.
Broadband RF interference.
RF exposure hazard.
Interference with air safety devices.

Of course, if you just want to listen to the transponders, that just
requires a receiver, some way to process the data and it helps to live near
an airport with radar services so that THEY can send the interrogation
signal for you.

Decade counters are ancient technology. Microcontrollers can
count the signal and report the results in various formats, from
multiplexed LED displays to LCDs (my fave) to injecting Morse
Code into the receiver audio. There are kits (anybody?), or you
can roll your own. Microchip's application note AN592 is one
implementation, and many of the PIC-based counters are derived
from it.

One clever approach is to have the microcontroller not only
report frequencies, but also track trends (i.e. drift), so
it can apply corrections, Huff and Puff-style.

Hi and a great big "thanks" to EVERYONE for the many messages
concerning possible Digital Cameras and lenses to do "close_up"
and "oscilloscope waveform" photos.

A great deal depends upon the following:
1. How much I am willing to spend?
2. How heavy a camera (SONY with 3.5 inch floppy)
3. Do I want to a camera that has focus versatility
without need to change lenses or am I willing
to use closeup lenses.

I must study your replies and do my homework.
Thanks again,

Others have suggested microcontrollers, your idea does work. I used 7490's back in High School and built a freq counter that read in binary, at the time I thought it was the coolest... You'll need an accurate clock source for gating and you need to figure out how you want to reset the counter before updating. Should be fun.

Try coathanger wire for the iron, and #16 solid copper... You need LOTS of
junctions for 40 W output! I saw something like this once as a jr high school
science project and it looked like about 30 junctions, powered by a candle
flame. The wires were about 3" between junctions.. There is probably an optimum
length between prohibitive wire resistance losses and cold junctions too close
to the hot ones, and so too hot due to thermal conductance. Cooling the cold
junctions while heating the hot junctions should increase power. I guess
cooling was simple in Siberia!

The device powered a simple receiver. It could have maybe used to power a
small lamp, for a candle powered light. <G>

I bet a current passed through this arrangement, while it would heat up the
wire, would nevertheless give you a slight temperature differential between the
two sets of junctions. Not usable, but measurable maybe. Anybody know if this
is the basis of the Peltier Junction device?

Peltier devices are usually used as heat pumps -- you apply electrical power, and one side gets cold and the other hot. They do, however, work in reverse so could in theory be used to generate electricity in the same method as the generators being described.

Many years ago I read a tutorial about how Peltier devices worked and as I recall,there were several effects present, the Peltier effect being only one of them. The devices at that time (and I believe still) used doped bismuth telluride, a semiconductor, between the hot and cold sides. The device is typically a long series of alternating rods of P and N material, electrically in series and thermally in parallel. At each side you end up with a bunch of P-to-metal and N-to-metal junctions where the rods are soldered to conductors on the end plates. Although I'm sure the dissimilar-metal-junction effect is present, I believe that the other, dominant effects depend on using doped semiconductors. Sorry I've lost track of the tutorial.

The interrogator transmits on 1030 MHz and the aircraft reply on 1090 MHz. There are several coding systems for both the transmitter and the responder. There are military and civilian interrogation codes and replies can be identification, altitude or special communication codes. There is a new civilian mode called "Mode S" for selective interrogation of specific aircraft. The civilian identification (not to be confused with the ID pulse) codes are called Mode A, the civilian altitude codes are called Mode C. These correspond to the military codes Code III, A&C. The military code Mode I is seldom seen. Mode II is still used. Higher modes will not be discussed.
With the exception of Mode S and military codes above Mode III, the interrogation sequence consists of two pulses. The spacing determines the code. There is a third pulse that is radiated from an omnidirectional antenna at the tracking site. Comparison of the received strength of this omni pulse and the other interrogation pulses will indicate whether or not the receiver is in the main beam of the tracking station or picking up a sidelobe. Hence, this pulse is for sidelobe response supression.
Timing, for range measurement begins with the second transmitted pulse. It is assumed that there is a fixed delay in the responder system.
The response consists of two framing pulses 20.3 microseconds apart with twelve other pulses spaced in between the framing pulses to carry the coded reply. The code pulses are 1.45 microseconds apart. The center pulse is not used. The pulses are interwoven, A1, B1, A2, B2, etc. For ID purposes, another pulse can be added to follow the last framing pulse by 4.5 microsecond (if memory serves)..
Mode S is a whole different ball of wax.

Thanks, Roy...looks like the dissimilar metal junctions might have been the
enspiration for the Peltier junction... or maybe not. Anyway looks like a lot
of fundamental differences in operation of the two.

Somebody is selling a sold state refrigerator about the size of an ice chest
that is, of course, reversible, i.e. can keep stuff hot as well as cold.
Obviously it uses Peltier junctions. I would like to see a console beer-- er--
I mean DRINK holder for pickups and cars that would keep that sucker cold
forever. Maybe auto-feed of a new can every time the truck is started. Maybe
it's time I started tinkering with Peltier devices...

I have one of those Peltier fridges. When it is cold inside and hot on the outside of the fridge, the fan will continue to run after you unplug it. This would indicate that the junction is producing DC because of the temperature difference. I wonder what would happen if you put one side of the junction in a pail of cold water and heated the other with a flame (or solar collector)?

Do I smell an experiment brewing?

They do generate electricity when there's a temperature difference between the sides, but the ones I've played with generate at a very low voltage. Also, the semiconductor rods are soldered onto the end plates, so you'd have to keep the temperature below the melting point of the solder. As I recall, the semiconductor material itself won't put up with extremely high temperatures, either.

I have a Beckman LM22A meter obtained for $90 at a swapfest. It does 0.1 pf minimum readable unit -> 2 mF (that's 2000 uF) as max unit, and 0.1 uH -> 200 H, as well as 0.1 ohm -> 20M. Sometimes the cap scale 200 pF, the most sensitive, does not correctly read caps out of its range, and it also shows 100 pF for a short, but you can tell this by reality checking on the next higher range for bigger caps, and the ohms scale for shorts. Other than that, I love the meter, and use it all the time.

I think there was, likewise, a mention in Wireless World (in the 1970's,
during the UK changeover from coal gas to natural gas, of someone asking
the Gas Board to convert their "wireless set"...

Thermoelectric potentials are listed in data books, I'm not sure about
copper/iron, but copper/nichrome is about 25?40? uV/kelvin.

wait... I have data for copper/constantan (4.28mV/100K) and
iron/constantan (5.4mV/100k) so I'd expect copper/iron to give the
difference (1.12mV/100K) or 11.2 uV/K.

Given 500K thermal gradient (much more and the hot end starts to glow)
you'd get an EMF of 5.6mV per hot/cold pair of junctions. So if you want
6V, think about 1000 iron, 1000 copper wires joined up... the actual
terminal voltage you get will depend on the current you want and the
resistance of all that wire... (unfortunately iron is pretty
high-resistance)

Now gas central heating units use a single thermocouple (whose hot end
glows red in the pilot light - say 1200K??? - to power a solenoid to
hold the gas valve on. Using the right metal - say copper/constantan,
that implies 5.4*1200/100, or a solenoid that holds in at 60 mV. Pretty
impressive unless I've got it wrong...

Peltier effect looks much more promising.

- Brian

I purchased an Escort ELC-131D a few months ago. This unit is also known as B&K 878 and maybe other names. I can't vouch for its accuracy, but I can say that it seems to be very close on measurements, and it is very easy to use. It will measure resistance from 0.001 to 10M, capacitance from 0.1pf to 1mf(milli), and inductance from 0.1microH to 10,000H using either 120Hz or 1kz test signals. It will measure Q and dissipation and has some other neet features like sorting. This also the first handheld meter I have ever had that allowed external power to be used. I would recommend this meter as a good general use instrument, but don't expect lab quality from something that costs only about $220US.

You are correct, I think HOME DEPOT sells a Generac Transfer Panel with 6
circuits that have double throw breakers for less than $400.

AH thanks tim i figured i was on the right track. iI'm stuck where you were i guess trying to figure out how to read the registers at a specific time. I know that a 1 second delay is to long between samples i figure about 100ms would be fast enough but how to generate that i'm thinking posibly a crystal controled clock but not sure if that will be stable enough. The othe thought was to use a voltage controled osilator with a zenier to provide stable timeing. but will have to draw up plans and see what works best.

Dear J.M:

A simple way to monitor changes in the earth's magnetic field is to set
up a compass and keep a very close watch on the needle. I kid you not.
There have been several schemes published in the last few years. There are
two basic approaches. You suspend a magnet in a jar, and put a mirror on the
magnet. You make a long optical lever and monitor the position of the magnet
by watching the beam.
The other scheme is that you put the compass needle in between a light
emitting diode and a photodiode, so the compass needle cuts the beam.

In both of these cases, you record the output with an analog to digital
converter on a computer that is running continuously.

There are some much more complicated ways to monitor the field, with
induction coils or fluxgate or other electronic magnetometers.

The problem with all of these approaches is that you need a
magnetically quiet site. Eg, what happens when a garbage truck pulls up
outside your house? My first attempt was to measure about 8 ft
away from a cloths dryer. When my wife put in a load of clothes to try, the
drum remembered that it was magnetised steel. It began rotating and
I got a real big signal on my magnetometer.

If either of these schemes appeal to you, e-mail me and I will look
for the reference.

You could build one but there would be a blank spot of response
(the CUT OFF freq) where the LP and HP filters would have HIGH
attenuation....likely if you build LP and HP filters with LP having
CO of 35 Mhz and HP having CO of 45 Mhz, you would get
excellent coverage below 30 Mhz and above 45 Mhz.
Comet does sell a diplexer as such.....and rated for 0-30 and 50-up.

Hi Mate,
One of the nifty items I have bought these past couple of years is the Almost All Digital Electronics AADE L/C meter kit. Measures well under 1 uhy inductances and also low pf capacitors. Very cute and smart display system allows one to do delta measurements and parts matching as well. Under 75 dollars in kit form and nicley packaged. Not a toy, but cute. Can'r recall the fellows webb site, but he has advertised in Nuts and Volts and has also authored articles in both QST and Nuts and Volts. Perhaps some of the other folks on the list can speak to the AADE unit.

Tnx Bob, Sacramento

289. Mighty Midget RX on the air!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-13 00:00:00 UTC
From: wmeara@erols.com
Message-ID: <35a97301.129802494@news.erols.com>
Source record: 81270

I solved my muting problems with the Mighty Midget Receiver. In addition to lifting the RF gain control completely off ground, I now also lift the cathode of the IF amplifier off ground. As you can imagine, this seriously reduces the receiver's gain!

I matched the RX up with a DX-60B (cobbled together from two hamfest-acquired junkers) and got on 40 this weekend. First QSO was on 7010 CW with W8DAN in Xenia, Ohio. Then today I got on AM (I have a crystal for 7295) and worked Jim, N8ULN. It was a real thrill to use the little receiver for a for-real AM phone QSO.

Operating flexibility will hopefully be improved when I get my VF-1 VFO going. My version looks like it was put together by a demented soldering school drop-out! The bright side is that by tearing it down and putting it back together again, I'll experience (sort of) the joys of Heathkit building.

I hope all the other MM RX projects are going well!

The reason I got away from the scanner route (I own great scanners...) is I could not justify the cost of processing just to turn around and scan the image. Whenever you scan you will loose detail compared to a GOOD digital camera. Then there is the time lag...Let's see...use the roll of film up (or waste the rest of it)...PAY FOR PROCESSING, pick out the FEW pictures you want to keep and the FEW you want to scan. Scan them and convert to an appropriate format...sorry, I don't have that much time.

I just got back from a portable op with a homebrew antenna. I'll post a picture a little later.

Daren,

You are actually on the wrong NG for this kind of question. But nevertheless:
1. Free Agent is one of the most widely used newsreaders (aem, why do I still use Netcrap?...:-( )
2. HTML and pictures are *NOT* welcome in Newsgroups, except in those explicitely used for binaries. HTML expands a message up to four times without adding anything useful. Binaries in non-binary newsgroups would certainly blow up the usenet, if generally used. Get some FAQ about the general structure of the usenet and You will understand why (BTW: usenet <> internet).
3. If You can't resist reading binaries in newsgroups (AFAIK You can save binaries even if You can't display them in the newsreader) use Netscape or some other "bells and whistles" system.

FOR SALE
Complete kit of 1.2GHz Multifunction Frequency Meter as described in
Elektor Electronics magazine, issues December 1992 through March 1993.
Superb design. Few available.
Kit includes all parts, microprocessor, EPROM, printed circuit board, front
panel foil, ready-drilled case, LCD, wire, connectors, copies of articles,
in short THE WORKS.
This instrument has been built by the thousands by hobbyists and
professional lab workers worldwide. Now the last few are available at a
knock-down price of only 75 (seventy-five) British Pounds (GBP) plus P&P
(GBP 5 inside Europe). P&P Outside Europe: pse enquire.
Period/Pulse measurements, also very SLOW (below 1Hz).
PC RS232 Interface, LCD readout, Analogue/digital inputs. Portable, 9-volt
battery operated.
Will ship anywhere in the world. Cash payment only.
Email to Anita
techtext.antispam@worldonline.nl

There is nothing in any way advanced, complicated or exotic about
using microcontrollers. They are a tool (albeit a powerful one)
for solving problems. Nothing more. Of course there is a learning
curve - but all tools come with learning curves.

There is all kinds of technical information on the web, and a
cursory search turned up 4 different PIC-based frequency counters
(source, kits, the works) in a couple of minutes. This is hot
stuff these days: have a look.

Cost is a non-issue - besides, have you priced TTL these days?
You can download all the software you need from the Net, and
you can download documentation too, though I supplemented my
electronic PIC information with a Microchip manual that I bought
at a swap meet for $CDN 2.00 (replacing my old dumpster-dive
special). My PIC programmer was a bit of a splurge - I bought
a new DB-25 connector for it, and a new parallel cable to plug
it into my computer. The rest of the bits came from my junkbox.

It works fine, and has given my old IBM PS-2/25 a new lease on
life. It was always a bit light to hold doors open... :-)

304. Cheap gadjet like FM/VHF (118 Mhz) reciever needed.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-13 00:00:00 UTC
From: M Stone <nospam@nospam.net>
Message-ID: <35AA1581.6299@nospam.net>
Source record: 81285

Hi,

I'm looking for plans to build a cheap-gadjet like FM reciever, to
listen
out avation VHF freqencies (118-136 Mhz). Is it possible to modify an
FMradio to recieve these freqencies? Are the any plans available for a
very cheap radio to listen out these freqencies?

I'm looking for a gadjet type of thing without any bell-and-whistles,
that can just sit on my desk preset to 1 frequency, with low output
levels.

Any info is appreciated.

Thanks,

Micheal

Okay Leon, if YOU don't want me to I won't. I sure wouldn't want to make you cross. My point is that digital imaging and the fast response time has the potential to make newsgroups such as "homebrew" even more enlightening and interesting. To use an old saw, "a picture is worth a thousand words." It does require acceptance of new ways of doing things though.

Hi Everyone,

My name is Jim and I'm new to amateur radio and electronics in general. I recently bought a tentec 4band short wave radio receiver.It came with great instructions on how to put it together and operate it, but with only a general overview of how the circut actually works.

I would really like to know technically how the circut worsk.. ie ... .5 volts dropped on this side of the circut .. You know an in-depth technical explanation on exactly how the circut works.

Does anyone know where I can find someone to explain this to me? I am willing to pay somone a small tutoring fee for working through the circut, explaining all the voltage drops and so on.

Thank you,

txroadrunner@earthlink.net

You've got my vote on more clarity on subject lines. I go right past them
if they aren't clear. There's too much to read to open every post that
isn't clear. BTW, I changed your subject line to make is a little clearer.
;>)

>Well, now we have objects that have negative resistance. Ohm would
>be spinning in his grave. ;-)

Well, R=E/I is only true for a steady state DC circuit. In the more general case, resistance is defined as the real part of an impedance. And impedance is defined as the ratio E/I in all cases, DC, AC, transient, etc. Impedance is R+jX. The real part can be expressed as R = E/I * cos(theta). For pure DC, cos(theta) is 1, so the solution degenerates to R = E/I. In all other cases we have a mixture of resistance and reactance expressed by the ratio E/I.

What you are thinking of is called a resistor. That's a physical object which transforms electrical energy to thermal energy. A resistor has the property of resistance, but the resistance property isn't limited to just resistors.

The characteristic impedance of coaxial cable, for example, has a real part to its impedance which is resistance, usually 50 ohms. But it doesn't represent a resistor transforming electrical energy to thermal energy (well, coax does some of that too, but that isn't due to the real part of its transverse characteristic impedance, rather it is due to its longitudinal copper loss).

Active devices, tubes, transistors, ICs, tunnel diodes, etc, also show an E/I ratio while operating, and the non-reactive part of that ratio is resistance. But it may

not be *dissipative* resistance, it may be device dynamic resistance instead.
In the case of a tube, that's a function of grid drive and gm, in a transistor it's a function of base drive and beta, etc. It isn't dissipative (though device intrinsic resistance is), rather it is more properly considered a *valving* action (and the Brits call tubes valves for that reason).

A two terminal device with gain has a negative resistance, IE the slope defined by delta E over delta I is negative over part of its operating range. Tunnel diodes show this property as do current starved gas tubes. A tube or transistor amplifier with the proper feedback arrangement can also show negative resistance. In fact you can simulate a tunnel diode that way. So the ideas of resistorless resistance and negative resistance have been around for a very long time.

Go get the book "The Art of Electronics" by Horowitz and Hill. It explains the fundamentals of circuits (of all kinds) quite well. The ARRL Handbook is also a good place to start to learn about radio circuits. After you've digested those, get Wes Heyward's "Introduction to Radio Frequency Design". Once you understand that, you're well on your way to mastering RF circuitry and will be ready for Chris Bowick's "RF Design" and other more specialized tomes and manufacturer's application notes.

These volumes may seem overwhelming if you're currently at the level of "Mr. Tompkins meets the Electron". If so, you may want to start with basic texts on electricity. I can't think of a good book at that level right off the top of my head, but I'm sure there are others here who can. I dimly recall some books with titles like Basic Electricity and Elementary Electronics, but I'm not sure of the actual titles or authors. It's been 35 years since I was at that level.

What you need to know is way beyond what can be conveyed over the net. You need to do some background reading before you'll even know the right questions to ask. But once you know what you want to know, we may be able to be of assistance in clarifying some point or the other here in this newsgroup.

310. Re: Digital Camera

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-13 00:00:00 UTC
From: Robert York <reyj@micro.ti.com>
Message-ID: <35AA47CD.2BF5FEF8@micro.ti.com>
Source record: 81291

There are several issues involved here. I notice no one asked the original poster what he intended to do with the photographs. If these photos are taken for his own amusement/satisfaction then perhaps a digital camera will do. If they are taken for submission to a publication, as some project photographs are, then a different set of rules apply. Most publications want film. I was also amused by the reference to "loss of detail" as the reason for going from a scanner to a digital camera. If "detail" is important to you go with film, which still has resolution several orders of magnitude better than any digital camera likely to be found in consumer's hands. Archival storage may also be a consideration. The cost of a CD-writer added to the price of the digital camera might tend to skew those "bang-per-buck" figures back in favor of the $5 yard sale camera mentioned earlier in this thread.

The only experience I have with output networks is with class-C amplifiers. In the ones I design, the transistor is as much like a switch as I can make it. In a high-efficiency design, the collector waveform looks more-or-less like a half sine, but with accent on the "less". It's not unusual to have a 30 volt positive excursion with a 12 volt supply. At the output of the collector network the waveform is reasonably sinusoidal. It's pretty flakey to talk about the phase shift between the input and output waveforms, since they have very different shapes. You could, if you would want, look at the phase shift of only the fundamental part of the collector waveform, but I'm not sure what its significance would be. The chief objective of the output network, in my opinion, is to try and assure that the current is low when there's voltage across the transistor, and vice versa. This principal was explained by Sokal and Sokal in their writings on Class E amplifiers. Filtering is another issue which can be covered separately.

It's easy to show that there's a lot more to an output network than just impedance matching. For example, an inductor input L network having the same impedance matching property as a pi net can ring terribly at a high frequency when confronted with an input waveform like the one at the collector. (See "On Solid-State PA Matching Networks", Technical Correspondence, QST, October 1978, reprinted in _QRP Classics_, p. 262.)

This hasn't answered your question except to explain that it may not be applicable, at least to the types of amplifier I'm familiar with. But you might also consider another factor. Remember that the phase

shift through a transmission line is equal to its electrical length only if the line is terminated in its characteristic impedance (or a few special cases such as a half-wavelength line or resistively-terminated quarter-wavelength line). So I'm sure you could get 180 degrees or more phase shift from a symmetrical pi network (or shorter-than-180 degree transmission line) with some terminating impedances. Also, the networks used for collector matching are frequently non-symmetrical, so they have another degree of freedom not included in the statement I made earlier.

I'm cross-posting this to rec.radio.amateur.homebrew. Since it's getting off the subject of antennas, I suggest that any continuation of the subject be pursued there instead of in rec.radio.amateur.antenna.

Roy Lewallen, W7EL

<pet_peeve>

No, Rick, actually, in this digital age, the picture you posted to the newsgroup is worth not 1,000, but about 20,000 words in terms of data size.

That means your post took up the same space as 40 500-word plaintext Usenet posts, on EVERY NNTP SERVER ON THE PLANET.

For that reason, many news services don't carry the alt.binaries groups (where such posts are supposed to reside) -- they can't afford the space and/or network connectivity to manage the traffic. Posting large binaries to non-binary groups is a darned good way to discourage these providers from carrying the affected groups. Everybody stands to lose when that happens.

This isn't a matter of opinion, or of my desire to be some kind of "net cop," but simply common courtesy and common sense. I haven't even mentioned the hassle you can cause to users with slow connections and/or auto-downloading news readers, who often must pay by the minute for connect time. Ethically, the admonition against posting large binaries falls into the category of "Hey, wouldn't life suck if everybody did this?" Not "Hey, I own Usenet and therefore have the God-given right to tell you what you can post."

Consider how insanely inefficient it is for you to cause 130K of content to be delivered to the thousands of news servers in the world that carry r.r.a.h, and possibly tens or hundreds of thousands of users who auto-download. Please think about getting a web page or an FTP site, so that you can post links to your photos and other content instead of copies of the content itself. (If you use the full http:// prefix in your posted link, most modern newsreaders will present the link as a clickable hyperlink that will take their users straight to your page.) That way, users who are interested in seeing your data can get it, and users who aren't will only see abour 40 bytes they don't care about, instead of 130,000.

</pet_peeve>

BTW, that does look like a pretty FB camera. Have you tried shooting a scope or spectrum-analyzer display with it yet?

Yes, it's possible to modify an FM radio for that purpose, but because aviation comms use AM, it's a more complicated problem than just adding a frequency converter before the radio's front end. The local oscillator, RF amp, and mixer stages must be retuned; the limiter must be disabled; and the discriminator must be bypassed with a more conventional AM detector.

Unless you are actively looking for an RF project to tackle, your cheapest and easiest solution might be to hunt down a used low-end scanner or portable radio that covers the desired range.

Hi Rick OM,
As an inveterate photography nut, I would like to comment on the use
of "digital" cameras vs film.

If all you are interested in is smaller pictures, with snapshot quality, then the digital camera is fine. But even at 1200+ pixels resolution, it falls far short of film for image quality. This becomes very evident at 8 x 10 print sizes and larger from 35 mm negatives. The image quality of a typical $1000 digital camera is about equal to that of a single-use 35mm snapshot camera ($7 or so), which is limited of course by the lens, not the film. The ads for digital cameras naturally do not point this out.

In the commercial photography field, digital cameras find some use in catalog work, where print sizes are small, and so resolution is not paramount. But when you need standard image capture quality for larger prints, there is no currently economical subsitute for film. If there was, you can be sure the professionals would be using it!

Viewing prints on video, or on computer monitor screens, is at a tiny fraction of the resolution inherent in silver halide image capture. Ever see a print made at TV resolution? Pretty ugly; that is why TV screen printers have not taken off.

Film is going to be with us for long time to come, until there is a breakthrough of about 1-2 orders of magnitude in CCD imaging and electronic memory cost/pixel. That will not happen overnight. For just PRINTING, however, inkjet and other technologies are making inroads into silver halide's domain. They are not there yet for the consumer, but we are getting closer.

73,

Don, W6JL

Hi James OM,

It is unfortunate that today's equipment manufacturers including even kit suppliers like Ten Tec do not provide a theory of operation of the circuit in their materials. (This was only one of the many nice things about Heathkits; they all provided details of the operational theory of the gear you were building, which is essential for troubleshooting). Your questions are not of the type that can be answered directly by internet respondents. What you need to do is some study and homework on your own. Try the ARRL handbook, so that you can come up to speed enough to know which questions to ask. Also, study Horowitz's "The art of electronics".
Good luck and have fun learning,

I need a ethernet controller+transciever on-a-chip to use in a TNC-like project I am designing. I know of the national chips, but these device cost major bucks from digikey ($50). Thats not an amount I can afford to accidently blow with a misplaced wire, etc. I'd like it to be available in a casing I can plug into some sort of wire wrap socket (a cheap one at that). Suggestions?

Also, where can I find a good source of DIP 68000 processors?

I agree completely. Which also describes about 95% of the non-commercial
photography done.

>But even at 1200+ pixels
> resolution, it falls far short of film for image quality. This becomes

I agree with this also. How often does the average person ask for 8X10 and
larger prints?

>The
> image quality of a typical $1000 digital camera is about equal to that

> do not point this out.

I disagree with this. That was certainly true in the first generation
cameras that I played with.
The technology has improved substantially.

> In the commercial photography field, digital cameras find some use in

My guess is that it is less than 2 years away. Kodak is certainly getting into the digital
imaging products in a big way. They probably see the writing on the wall...

But I also believe that there will always be film cameras for those special hi-res applications and nostalgia buffs. I am reminded of when music CDs first came out. Nobody expected the transition to be as fast as it happened from vinyl to CD. And there were many who decried the CD sound as "lacking warmth" that the vinyl was able to capture. There still are stores specializing in vinyl albums but the CD technology pretty much rules.

> For just
> PRINTING, however, inkjet and other technologies are making inroads into

If that special slick paper would get any cheaper life would be good!

> 73,
> Don, W6JL

You and I think alike on most issues. My point in supporting digital images is that the technology is improving dramatically. For us "early adopters" that have been playing with this since day one, the gains that have been made have been, uhh, cosmic. I can hardly wait to see what comes out next year. For the average user, which excludes most COMMERCIAL applications, digital is almost, if not already, there. What I find happens most often is that people go into their local Circuit City or Computer City and buy a $200.00 digital camera. Their images suck and they assume that it is true for all digital cameras.

Don, thanks for a nice response.

Jim,

I don't know where you live, but if you have the schematic (not just a block diagram, but a full schematic) just look up the hams in your town on a CD ROM, and by the third or fourth phone call, you will find someone anxious to pore over it with a fine-tooth comb, and explain it in detail (and they'll be happy to do it for free).

It's coming, but not yet. For the present, you have to realise that the Internet is world-wide, and in many countries (including Leon's and mine) people have to pay by the second for phone time. That makes large unsolicited binaries very unwelcome, and especially in newsgroups where there are lots of messages to download.

Not your binaries, of course, Rick - it's all those *other* guys who can't be trusted to use binaries only when needed, and also to keep them small.

It's pretty good from 3MHz to 300MHz, just with the proper circuit around it. You won't like the price of the socket and support parts. Try some older ARRL Handbooks for a circuit. The 80's mid vintage seems to be a good place to start.

Yeah. Some pix are ok, if kept within reason. Noting IMO wrong with a 3 or 4 kb gif file of a circuit or something when needed to explain something. I personally like that more than some feeble attempt at ascii art. But let's be reasonable... I had somebody email me a BMP file a while back, of a crystal receiver circuit. It was evidently mouse-drawn in paintbrush. Black and white were the only colors used. The file was almost a half meg! Evidently we were looking at high res and umpty-eleven bit color. The same circuit could have been done in B/W and converted to a 2K gif file. The emailer wanted to know if it would work. Naturally I hit the "download file now" button, and it took a good while to download that sucker, lemme tell you! I was just a little bit upset. We should post pics on these groups rather sparingly, only when needed, and emailed only when asked for, and they should be formatted to be as small as practical for the benefit of those with slow computers or slow connections, or nearly full hard drives.

A binary newsgroup within the r.r.a might be nice, tho. Meanwhile, we can certainly put misc series of pics up on the web.

Yes I can confirm that at least in the early 80s VHF radios and
telemetry equipment on small unmanned oil platforms (in the South
China Sea -off the Brunei coast)were powered by gas fired
thermo-electric generators. Don't know whether these are still in use.

326. Amp Restoration

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-13 00:00:00 UTC
From: David Kao <david_kao@hp.com>
Message-ID: <35AAB369.16AC@hp.com>
Source record: 81307

Hi:

I had a chance to acquire a few Transworld (Escondido, California) T1000 HF linear amplifiers. The amps are rated at 75 watts in, 600 watts RMS CW or 1000 watts PEP SSB out.

These amps contain 4 amplifier modules, a 4 channel band pass filter board and a huge power supply in each of them. The DC supply to the amp modules is at about 48 volt.

These amps look truly heavy duty and weigh about 100 lbs each due to the big heavy AC power transformers in them. The AC supply can be configured to accept 120/240 volt 50/60 Hz. The AC transformer has a separate winding loaded with a 16 MFD cap for AC stablization.

The amps were originally owned by a US AFB but were auctioned off. They all have FCC ID tags and mfg serial numbers. I bought the amps from a well established business which decided to let them go.

My question is how much would these amps be worth for if they are restored to fully functional? I plan to restore then sell all of them but keep one for myself (I don't need more than one I think). I will dismantle one to supply the parts for the rest. I will get to keep some remaining parts.

The reason I need the info of their value is so that I don't lose money in the project. I hope to get mine free in exchange for the work for the restoration (and lose one of them for the project).

How is the interest in such amps by HAMs? Do they want more power? Without knowing the market value of them I am a bit hesitate beofre getting started. I could unload them now without losing money. But that's not my intention to buy them in the first place.

Any info regarding these amps is much appreciated.

Regards,

David

Don't call radio shack... but do go there and try to get a book they have. I'm not exactly certain of the title, but it is a green and white cover paper back (8 1/2 x 11) and was written by Forest Mims... it is one of the best books that ever explained basic electronics to me. It may not be able to tell you how your Ten Tec kit works, but it will help you to have a basic grasp of electronics in general. (Actually, that text doens't get very deep into any sort of radio theory at all.)

Good Luck!

How cheap is cheap? Ramsey has a receiver kit for $30.00
www.ramseyelectronics.com). Also be advised that aircraft radios are AM,
not FM, even so, if the radio has an FM demodulator which is subject to AM
rectification, it might be able to hear aircraft too. Before you go
modifying any radios, check to see if a cheap radio is already available
which covers the band. Check discount stores, electronic stores (and their
junk bins, if any), and thrift stores.

Usenet works as an application on top of the various networks and
requires that each ISP that runs a news server pay for a big enough
machine to process it all. A typical picture is 50 times the size
of your average text posting. Just 1 posting would double the
volume in this newsgroup.

Rampant binary posting drives small ISPs off Usenet, centralizes
control with a smaller and smaller number of companies, and makes it
impossible for smaller and out of the way sites to participate.
So much for cooperative anarchy, it falls apart in the face of
bad behavior.

Stick it on the web, that way only the people who are affected are those
who want to see the picture.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-14 00:00:00 UTC
From: machine.1@juno.com
Message-ID: <35acc1ff.22218104@news.erols.com>
Source record: 81219

Anyone have the programming info on these radios? It's dipswitch and pushbutton inside the case and I hate to pay RatShak $40 each to change the freqs to match the rest of my radio system.

336. FS 4CX5000A, socket, etc.

Newsgroup: rec.radio.amateur.homebrew

Hi,

I have a package deal for hi power enthusiasts. The package consists of:
1 - Econco rebuilt 4CX5000A tube which has full emission. (about 1 hour of filament use)
2 - 4CX5000A with low emission, which can be rebuilt or used for chassis layout.
3 - Eimac SK300 socket in very good condition.
4 - Electro Engineering 7.5 Volt, 75 amp filament transformer with 240 VAC primary.
5 - Eimac spec sheet for 4CX5000A.

Price is $650 for the package including shipping.

Please remove the xyz if responding.

73, Jack

Well since I can't find a reasonably priced IC-551D I figured I would try for a Swan 250 again... :)

Looking for a good working Swan 250 or 250C with matching power supply and mic. Cosmetic condition not all that important but prefer the rig to be in good working condition with full power output. Wanting to get back into 6 meters on a budget but with more than 8 or 10 watts.
Please email what you have and your asking price.
Thanks !

Try looking for obsolete computers at yard sales, thrift shops, etc.
One near me has a few Macintosh's real cheap, they use a 68000, most
likely DIP in a socket. Amiga also uses 68000 DIP (8MHz)
Too bad motorola discontinued the 68008

Hello Jim,

Why not discharge the batteries and hook the charger up temporarily while monitoring the charging current? You may not have to do anything to limit the current. But, you also need to measure the current at full charge to be sure you don't cook them if you forget to disconnect the charger!!

Also, you may not be able to obtain a full charge if you have only 6 volts because the nicads probably need more than 6.0 / 4 = 1.25 volts each to achieve a full charge. But, most wall transformer-type chargers have an open circuit voltage that is greater than their rated voltage, so this may not be a concern. That is, if it is rated at 6.0 volts at 400 MA, it may well provide 6.5 to 7 volts or more at lower current levels.

I don't know what the charging specs are for the batteries you are using - just be sure that you stay within those limits.

Also, the radio may have some circuitry that is involved in the charging process. If so, all of the foregoing may be moot and you may even need 10 or 12 volts in order to charge batteries while they are in the rig. In addition, you may only be able to charge them at 50 MA or so as would be determined by the above mentioned circuitry.

Regards,

Bill

Wait a minute. An old Mac is still fairly useful, more so than an XT since the Mac always ran a graphical interface. I was using a Mac Plus up till the end of May, when I bought a Mac LC at a garage sale for fifty dollars (with monitor). It's only because people are saying the old Macs are obsolete that someone without a computer doesn't buy one of those old Macs, and instead have no computer at all.

They are probably less common, but I'm sure there are industrial circuit boards that used 68000 which wouldn't have much application without a lot of effort.

And, I have yet to see a Mac where the 68000 is in a socket.

Of course! When my 4th grade classroom first set up their individual web
pages they used a ton a high res images.
It didn't take them long to realize that nobody, including their parents,
wanted to sit there and wait for the images to load.

Another low-friction method is fluid suspension. I used this to determine if pebbles or rocks are slightly magnetic. Put the pebble on a plastic jar lid (inverted), and float it in a plastic bowl of water. Then hold a strong magnet near it and see if the boat moves. If the magnet is floated, this makes a good compass.

Another method is AC eddy current magnetic bearing suspension. Wind a coil of close-wound turns like a hoop and mount it horizontally with some space between it and the table-top. Construct a power oscillator circuit using the coil in parallel with a capacitor to form a resonant circuit. Choose the number of turns and oscillator frequency to maximize field strength while having a shallow skin-depth of penetration into the thickness of copper that the suspension cone will be made from. Make a bowl or cone out of sheet copper and "float" it on the AC field of the coil. Now you can place magnetic objects on an almost frictionless bearing. To do the job right, place the contraption in a vacuum. With a spherical container used instead of a cone, and with another identical coil above the sphere, a 3-D orientable contraption is possible.

347. Mistery UHF/VHF board?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-14 00:00:00 UTC
From: "Peter E. Orban" <Peter.Orban@nrc.ca>
Message-ID: <35AB3D7D.2781@nrc.ca>
Source record: 81231

I picked up a free board at a ham flea market over the weekend I would like to find out more about it. The boards has the following main modules on it as far as I can tell:
- I synthetised oscillator using the MC145106 and MC12013 chips with two crystals in it, marked 10.240 and 27.400. All the coils in the synthetizer are metal slug tuned.
- A 5.120 VCXO, the output of it probably multiplied, as it progresses through the stages, it first has ferrit cored cans, while the last couple of coils have metal tuning slugs. The VCXO has about 8 LS TTL MSI and SSI chips before them controlling it, consisting of counters, flip-flops, and simple gates.
- There is probably a mixer, marked DBM2 on the circuit board, that gets the ouput of the osc. and the multiplied VCXO. The mixer looks just like a MiniCircuit DBM, no markings on them, and it only has four pins, and not eight.
- After the mixer there are more transistors and coils, but all tuned by ferrit slugs. The end of that chain goes to a coax stub, that was cut off, probably the RF in/out.
- From that coax stub, there also goes a filter chain, this with air core and metal slug tuned coils.
- After that filter there is another of that no-name mixer, and there is a crystal marked 37.850 next to it. It is also next to that sythetizer.
- The mixer feeds a 10.7MHz IF strip with ceramic filters and TA7061 and TA7130 ICs. At the end of the IF strip there is a LM311 chip.
- All connections to that board is via that coax and a 26 pin header connector.

The board is beautifully made, silk screened, about 6"x10" in size, on one side there is 8042 (date?) stamped on it with the serial number, on the other side marked Part No GE-80B-1774, Network Resources Corp, Japan.

I am wondering what frequency range would that board have worked, what are those funny looking double balanced mixers, and in general, if the board is useful for something (I have no 2m or 70cm equipment yet) or just for harvesting parts.

Any help would be appreciated!

Thanks for reading it, Peter, VE3PEY

One does have to consider induction in any lightning mitigation design, but one needn't guess. All of the standard electrical laws work just as they do for any other situation. You just have to be careful to apply them properly and fully to the installation you're protecting. It is guessing which can get you into trouble.

Polyphaser, and a couple of others, make proper suppressors for computer networks or serial runs. Or you can bypass the problem for serial links by using short haul fiber optic links (available off the shelf from Black Box). The latter is particularly effective if you have to tie together two buildings which don't share the same entrance ground, and thus have ground loop issues as well as induction issues. (That's a problem we faced after our recent expansion. We solved it by making all interties between the buildings, video, audio, and data, over fiber optic links.)

Well I didn't even consider that part of the design. the more i work on designing the counter the more i relize how unsimple it is to do. Things were alot easier when I use to go from premade plans to completed project. Now I know how hard the designers work. So far I have figured going the long way about constructing the freq counter. will require 4 dual 4 bit counters 47390's 6 leds 6 bcd to 7 segment encoders. Havn't finished the timer portion of the circuit yet. Was planning on using a crystal oscilator but figured too unstable so will have to use a transister and variable voltage devider to make something stable. Looks like i may opt for the mentioned programable chips. would save me alot of headache.

Peter,
I tried replying to you directly but got bounced.
Here is the gist of the reply:

Peter,
I have found several of these boards, albeit slightly more expensive
than yours at $1 each!
As far as I can tell they are designed for spread spectrum data links.
They are only useful as a source of parts but very useful as that even
if the plated thru holes make stuff difficult to remove.
You only need four pins for a dbm and these work well up to about 250
MHz, I've not tried them any higher (and down to low HF) The
connections are obvious from the layout. Mine had lots of very neat
trimmers and a whole bunch of c-mos down one side. Those are worth the
effort of removal. I did spend quite a lot of time trying to dope put
the circuit but it is definately frequency hopping SS, and as such not
much use to me, for sure.

I also found a really nice little battery operated receiver from the
same guy, narrow band fm on a really odd frequency, between TV channels
4 and 5, It has monitor and line outputs (for recording?) and really
high sensitivity. He also had some really small transmitter boards that
were apparently meant to go with the rx. No prizes for guessing what
this setup was designed to do! I mean we've all seen the movie, right!
Just odd to find it at the swap-meet.

I have already used a lot of the parts from your mystery board in
various projects, a good find.

What?

If your crystal oscillators are that unstable, you must review your
design and construction technique. If you can make VCOs that are
stabler than crystal oscillators, please write them up for the
magazines - I, for one, would be delighted to know how!

You may still want to consider a kit. They are available and work
well, and, much as it pains me to say so, may be a better match for
your present skill level.

David, the rule of thumb rate for amps in this range is $1 a watt.
They're probably worth much more than that, but you're unlikely
to find someone willing to pay more than that for amps which
aren't name brand in the amateur market.

355. Seeking cure for computer RFI problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-14 00:00:00 UTC
From: owens@ale.atd.ucar.edu
Message-ID: <6ogfqb$1db$1@ncar.ucar.edu>
Source record: 81239

I'm looking for helpful suggestions for curing RFI caused by
a bank of 5 pc's that operate continually. The computers are
operated by a neighbor who runs a bulletin-board system from
his home. Due to small lot sizes in our sub-division my antenna,
an inverted-L for 160m, is located about 100 feet from the pc's.

The interference has a "buzzing" sound to it and blankets the
region from the upper end of the BCB to about 10MHz.The interference
is in the form of pulses that have a distribution similar to a
sine-X over X function. It is strongest at 1.7MHz and rolls off
with increasing frequency in a series of bumps. I'm guessing
that the noise is caused by computer monitors as the clock frequency
on the motherboard is well above HF in any current pc.

If anyone has experience in successfully treating a computer &
monitor to kill the emissions I'd be happy to know how it is done.
Since this is at the home of a neighbor I want to be prepared
before I get serious about offering a possible cure. The noise
level on my Ten-Tec HF rig averages S-7 to S-8 on 160M and is
somewhat lower as you go up in frequency.Needless to say my
low-band operations are at a standstill.

>

Anyone have any details on any of these generators? I found a company called Hi-Z but they do not give prices on their site, and you need a convertor to step the voltage up. I don't remember any convertors with the Russian device. If you at all remember these please post here, and I'd like to thank everyone else who has brought information, if I don't find the lamp generator, at least I know there are alternatives.

Thanks,

David

I'm looking for old style variable capacitors for a VHF tuner/balun I'm wanting to make (from the ARRL '60s-'70s VHF and Antenna books).

One of them is a 35 pF and the other is a dual ganged (I'd have to go double check the values).

If you know of a source of either used or new, I'd appreciate a reply.

Thanks and 73,
Daniel

From: doragsda@polymail.calpoly.edu
Message-ID: <6ofuqufdd1@cscnews.csc.calpoly.edu>
Source record: 81245

For Sale:

I have three Eimac 3-400Z / 8163 Tubes for sale as follows:

tube #1 is new, in Eimac box.

tube #2 is new, but has a "bad" pin - the small pins that come though the the glass have larger bushings soldered to them, someone has mucked with this one and there is solder all over the outside of the bushing. You should be able to make this tube work perfectly with a little effort. In Eimac box.

tube #3 is used, but has an intermittent grid-filament short. There is a little ceramic star shaped insulator floating around in it, probably related to the short. You could probably get this tube to work fine if you mount it solid and baby it. In Eimac box.

Asking $75.00 plus shipping for all three tubes or best offer.

Basically what I am after is a extremely quiet, propane powered power plant, for aparment living. It only needs to have enough power to effectively recharge a deep cycle over night (a medium size one) while simultaneously operating a low power packet system. I would like the generator to be capable of roughly 90 Watts continuous.

I like the idea of a sterling engine, but I haven't seen a source of the motors in the 3 to 5 HP range, and I have my doubts as to how inexpensive they will be. I did find a neat hobby version of the sterling, which I can send the URL to anyone interested when I get home this evening...

Normal Carnot cycle engine are out of the question, and Sterlings may too, depending on the sound pressure level generated.

The usability of these machines is in the eye of the beholder. Some people find them quite useful, otherwise they wouldn't still be using them. There is quite a large amount of info, parts, upgrades and software available on

the Web for these machines.

The facts are that only the following Macintosh models used the 68000 CPU:

The Macintosh (also known as 128k), 512k, 512ke, Plus, SE, and Classic.

The odds of running across one of these is not real high. There are better ways of getting a 68000 chip, inexpensively. The 68000 series is widely used in embedded controller applications. You might be more likely to find one in a crapped out consumer item that has a controller. I doubt it will be in a socket though.

Hi to all on the newsgroup and specifically Steve and Michael.
I have two brand new, never been used 68000 chips in the DIP package.
The full designation is TS680000CP10 date code 44th week of 1991.

I'm sure I've seen little snippets of information about the NE5205, but
I've never used it. I've added rec.radio.amateur.homebrew to the
newsgroups, where someone might be able to help. That might be the place
to continue the discussion.

An english design uses an engine like a Stirling motor without the
gear. The oscillating part moves a magnet in a set of coils generating
AC current. Any heat source can be used. Nearly zero maintenance.

Source record: 81256
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I have a bit of problem with the freq. split on my TS-700. As designed, Kenwood built the radio to handle 2mx in 4 single 1 mHz bands. This is fine except when using rptr pairs that span two of the bands. One of our rptrs uses an "old" split on 146.46T - 147.06R and since this is not a standard split, I must monitor the output on a separate rcvr in order to use it. Now to the question, has anyone been able to do a mod to the switching so that the TX and RX on the 700 are in different 1 mHz blocks. The darn thing has me baffled as the mixing is very unorthodox, it appears to filter high side on 144 to 146 and low on 146 to 148. Surely one of you brilliant electron hustlers out there must have scheme on how to deal with this quandry. 73 de VE6INM

The Russian gadget was written up in Popular Science or Popular Mechanics, if I remember right. You might get a reference librarian in a large library to do a stack search on the article.

As remember, the thing had a cylinder of thermocouple junctions and the heat was in the middle of the core, the outside junctions had fins for cooling. It didn't look very big, as I recall.

I think the problem in building such a device would be the configuration of the thermocouples, since you would need a goodly number for 40 watts at a respectful voltage.

Not too far off, is the "Lemon Generator" developed by the California fruit growing industry. Here is how to build one. Buy a case of lemons and connect them together with a penny and a nickel pressed into each lemon. Use series and parrallel elements to get the voltage and current you want. The neat thing about this high vitamin C generator is that you can used the lemons for lemonade after your QSO! (grin)

I think the Lemon Generator was actually written up powering a single CK722 regen Rx in Popular Electronics sometime in the '60s!

==========
It's intriguing to know for how long a 'lemon battery' would be
effective ,because of polarisation of the electrodes.

This has been a fascinating thread. They do work in reverse as generators. "QST" had a construction article a year or two ago about using one of these heat pump modules to generate a low voltage. The author powered a QRP rig from a setup using a Peltier device, a pail of ice water and a pail of hot water. Of course it works as long as there is a sufficient temperature gradient.

Another poster to this list talked about the red-hot thermocouple of a gas-powered furnace. We used to have a floor furnace that had such a control system. When we had it taken out in favor of a more modern central heat system, it was about 35 years old. One day shortly before it was taken out, I read the voltage across the open contacts of the thermostat and read about 300 millivolts. The heat and air guys who installed the new furnace said that this was probably a bit low as those systems are referred to as 750-millivolt systems. They said that the thermocouples tended to produce less voltage as they age. My meter was 100 K-ohms per volt and I was reading through the solenoid coil, but I suspect that it was negligible in contributing to the reading.

I must admit, that system confused me until I realized that it was a millivolt system. I just looked and looked for that transformer.:-) I finally figured it out, but I guess my brain is a little slow.

You may want to look for some EMI shielded rack cabinets to enclose
his entire system. These cabinets have fingerstock on the doors,
sheilded fan vents etc. Look for a "Tempest" rated enclosure.

I have seen these cabinets equipped with a glass door. The glass has
embedded metal screen.

You will still have to deal with the telephone circuits and if he has
a T1, the interface equipment may be radiating.

Good luck

The Peltier effect (heat/cool) is the inverse of the Siebeck effect
(thermocouples),
in fact, they are the same thing looked at from different angles. Of
course,
different materials are better at one than the other. So, yes you can use
Peltier coolers to produce voltage/current, but you may find that
thermocouples
do a more efficient job.

I have an NCR 12 volt 70 amp power supply I wish to trade straight up
for a working older 386 or 486 laptop computer preferably with at
least a 14,400 modem in it. Supply is a monster but works wonderfully.
Has adjustable over voltage. over current protection. I believe also
the voltage can be adjusted up to 24 VDC but would have to check on
that to be sure. Let me know what you have.

Right away I would suspect that his PCs may not be FCC approved for use in the home - can't recall what the specs are, but PCs designed to be used in industrial environments (Class B?) don't have to be shielded as well as those used in homes (Class A?). If he's got unapproved PCs which are causing harmful interference to another radio service, the FCC says he must turn them off. Getting the FCC to enforce something like this, however, will be next to impossible.

> I'm guessing that the noise is caused by computer monitors as
> the clock frequency on the motherboard is well above HF in
>any current pc.

You need to figure out for sure where the noise is coming from before you can fix it. If you think it's coming from the monitors, ask him to turn them all off for a few minutes and see if the noise is gone - if so, you know where to focus your efforts. Add split ferrites (not the cheap junk Radio Shack sells) to all cables attached to the monitors. For the lower HF frequencies you're interested in, I think type 77 ferrite material is what you want. Amidon and others sell the ferrites.

If the noise doesn't go away, it's likely coming from the PCs themselves. I would suspect the (cheaply made) power supplies as the most likely source - they're probably generating lots of noise and his entire house is radiating it from the electrical wiring. Brute-force A/C line filters are about the only thing that might help. Industrial Communications Engineers (ICE) is one source for the filters.

As someone else has suggested, a noise canceller may be a big help - most will accomodate an external antenna, which can be a short dipole located as close to the source of the noise as possible. Gives a very strong signal for the noise blanker to work with, and they generally work very well for that kind of noise. (By coincidence, I have a new MFJ-1026 noise canceler being auctioned right now on eBay - contact me if you'd like more info about it.)

You might do well to post this question on the RFI reflector - see
http://www.contesting.com/_rfi/
for info - lots of knowledgable folks over there.

Good luck!

Yep... this is the one. I actually have a collection of the 4-pin plug-in coil forms, and still have a 1H4-G tube in storage. To build this project today, the hardest part to obtain would probably be the vernier dial.

Out of this book, I also built an induction coil, and tried the magnetic communication scheme (forget what it was called) whereby you use a carbon mic, 6-volts or so of battery, and a hula-hoop sized coil of several hundred turns. Receiving end is similar. Ranges of several hundred feet are supposably possible. I could never afford enough wire. :)

Ahhh.... the memories! (At 34, I shouldn't be old enough to remember this!)

411. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6olljt$kj5@news.Hawaii.Edu>
Source record: 81192
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Subject: ** FLEA at MIT ** Sunday July 19th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 19th 1998
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***

413. AKAI AA M33 RECEIVER Components

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-16 00:00:00 UTC
From: Theo Lingmont <Th.J.Lingmont@wxs.nl>
Message-ID: <6olltp$g0931@reader3.wxs.nl>
Source record: 81194

Hello,

Is there anybody anywhere on this world who will be able to help me with:
a) a display unit, indicated as: "DRIVER PCB R4175517"
b) an IC 7, indicated as: "FUNCTION SW IC7 PD 4066 BC";
both for the above mentioned receiver.
Because of their oldness, parts are no longer available via official channels.
Just -may be- that somebody has such an old device in his cellar or on his loft or knows about a friend or an acquaintance who may have such a device in his possession and who does make no longer use of it. I do have the official schematics.
A message to this newsgroup or a direct E-mail to Th.J.Lingmont @wxs.nl would be highly appreciated.
Regards from Holland,
Theo.

Hi!

I foolishly sold my trusty Heathkit dip meter several years ago when I thought that I'd had enough of amateur radio. Well, the bug has bitten again and its time to raise another crop on the antenna farm.

Do any of you folks have a schematic for a dip meter?

Thanks and best regards,

Lee Jarvis

Cuba Ham Toroid Project

CO2KK, Arnie, an electronics instructor in Havana, Cuba, is working to help new Cuban hams get on the air by building simple, low power single band amateur radio HF transceivers from recycled televisions and radios. They lack toroid forms that will work in the range from 3 - 30 MHz.

Copthorne MacDonald VY2CM and I are asking hams and clubs who have toroids to forward them to Cop where they will be packaged and forwarded to Arnie.

Long-time hams will recall that Cop is the inventor of slow scan television (SSTV) and has had an amateur radio column in both CQ and Mother Earth News.

Cop writes, "it would also be helpful if those who happen to have printed data for their toroids (or toroids in general) send that too. Not essential, you might stress, but helpful if they happen to have it."

Please send toroids to:

CO/CM Toroid Project
Cop Macdonald, VY2CM
P.O. Box 2941
Charlottetown, PEI Canada
C1A 8C5

The customs sticker for any shipments coming from outside Canada should indicate that the contents are a GIFT which they are, and preferably show a value for the contents of something LESS THAN $25.00.

Help a Cuban ham get on the air.

Sincerely, 73

Jozef WB2MIC

PS Arnie CO2KK has a great weekly ham/radio program on short-wave called "DX

ers Unlimited." Schedule and information including simple ham radio
projects are at:

423. High Performance Receiver Design - Fractional-N Synthesizer

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-17 00:00:00 UTC
From: crabtreejr@aol.com
Message-ID: <1998071723114400.TAA28571@ladder03.news.aol.com>
Source record: 81124

There is a very interesting article on Fractional-N sythesizers by Dr. Ulrich Rohde in the latest issue of QEX, Jul-Aug 1998. The article can also be found on the Synergy Microwave web pages at http://www.synergymwave.com/What's%20New/Fractional%20N/fractional.htm

The use of delta-sigma modulation with a dual-modulus prescalar makes it possible to filter out the noise from the fractional division while maintaining a high reference frequency in a single loop. The advantages over using Direct Digital Synthesis are i) exact frequencies, not very close approximations can be generated and ii) it should be cheaper as the crystal filter which is recommended for removing spur energy is no longer needed. (For an example of a DDS-driven PLL see 'A High-Perfomance Hybrid Frequency Synthesizer', by Dr. Rohde, QST, March 1995, pp30-38.

If and when we see this type of synthesizer in ham gear remains to be seen. There are several patents listed in the article, which may cause companies to shy away. Chip development is expensive too.

While I'd be the first one to admit that Fractional-N synthesizer techniques
are useful, you have made an erroneous assertion.

>The advantages over using Direct
>Digital Synthesis are i) exact frequencies, not very close approximations can
>be generated

Where did you get the idea that a DDS can't generate exact frequencies, but
only "very close approximations" ??? A DDS can easily be designed to create
arbitrary frequencies with just about whatever step size one wants. Now, it you
choose to use a master clock which gives strange values of frequency increment,
that's your business, but it's not the fault of DDS techniques.

> and ii) it should be cheaper as the crystal filter which is

Not all applications of a DDS require such filters.

Source record: 81129
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I was wondering if anyone here had enough know-how to give me plans to build an FM Tranceiver. I have seen them at Radio Shack but they are expensive and you can't talk and hear out out of them at the same time (because of feedback, it's disabled). And also cannot be strapped to the inside of a mask. In order to avoid this I would like to make it rather thin in width, but up to around 8 inches in length but no more than an inch to an inch and half tall, and be able to bend the 8 inches. I would like to get plans for one of these to strap inside of my paintball mask to keep in contact with teammates. I would need to make two different kinds, (each on a different frequency) as to give the opposing team the same advantage. This would be preset in the tranciever and could not have the ability to be changed. The only controls desired are a switch or button to turn it on and off. For this to happen they would have to use at the most a 9-volt battery, but the the range wouldn't have to be that long, 300-400 feet if possible, more would be nice. I am not an expert in electronics, so detailed schematics would be appreciated. If you feel abliged, you could make me 10, 5 on each frequency and I would pay you for them. Name a price. Thanks in advance.

433. NOT A TOY

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-17 00:00:00 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <01bdb15b$0dee4020$LocalHost@default>
Source record: 81201

Brand new program RJELINE1.exe now available by downloading from my website. Free. No catch.

Complete and highly accurate analysis of behaviour and performance of open-wire transmission lines from power frequencies, through AF and HF to UHF, with ANY complex load/termination from short to open circuit, of any line length between 100mm and 10,000 kM.

You begin in a practical manner by entering nominal HF line Zo, wire diameter, line length and operating frequency. Then load impedance, R and + or - X. From then it's a "what-if" situation.

Computed results presented in a form suitable for investigating behaviour of open-wire feeders between tuning units and antennas. (Accuracy falls off for such constructions as a fully insulated line with a continuous spacing web.)

Use it to design the line itself, to design transformers between complex impedances, stub-lines, to predict SWR, predict input impedance in both series and shunt R and X component forms. And what really matters - the percentage of input power which is actually lost in the feeder. Who care's about SWR anyway?

Program contains several pages of operating notes and explanation.

Not zipped-up, about 40 K-bytes, downloads in a few seconds, does not make a mess of your filing system and can be used immediately on receipt.

Not a toy. Has been thoroughly tested but let me know if you suspect a bug. Would be pleased to have suggestions of any more items of output data you would like to see displayed in a later or specialised version. Its all in there somewhere, waiting to be dug out !

There are several in a book that I have called "1001 Practical Electronic Circuits" published by TAB Books of Blue Ridge Summit, Pennsylvania. Also found some in the old issues of "73 Magazine". Let me know if you want more info, as I can give you details on the full duplex homebrew unit that I have here in the shack. It is used by the Canadian Coast Guard (designed by one of them) and really works well.

Hi,

I have an application for a LM338K voltage regulator, but I can't seem to find the schematic I had for the proper hookup. Any one who could help me out with this, it would be greatlty appreciated.

Thanx in advance,
Mike

Hi Bill, I am not familiar with the radio you want to convert, but I did a conversion on an old SEARS ROADTALKER 40, Many years ago Sears was closing out stock on these 40 channel SSB radios for $69.00, they were selling for $279.00 at the time. I dont have to tell you that the day they went on sale, the ilses at the store were loaded with HAMS buying them!! A guy out in the midwest who went under the name of "CERTIFIED ELECTRONICS" I t hink it was, had a step by step conversion for this radio, I think he also supplied the XTAL that needed to be changed, anyway, I did the conversion and it works GREAT!! If he is still around he was the pioneer in the field of CB to 10 meters, see if you can locate him. Does anybody out there remember this guy??? Whats say Bill 73 LOU

439. Re: Phone patch plans!!!!!!!

But there was one in QST in 1981 that was far more modern. It used opto-isolators and such. I do think it was meant for use at a repeater site though. I came across the issue later at a used book sale, and was intrigued by it's use of semiconductors to do away with the coupling transformer. I remember when Don Lancaster wsa discussing phone couplers (I can't remember the technical name right now) and he lamented that they were still using transformers, and I sent a photocopy of the article to him as an example of what could be done. A few columns later he made a vague reference that I think was about the article I sent him.

But don't ask me to find the article or provide the date. I'm quite certain it was in 1981, but that's all I remember. I know I have the article around here somewhere, but I don't know where. At one point, I started shredding my magazine collection, saving most of the tehcnical articles, and while it shrunk the amount of space the magazines took up, it also made it a lot harder to find a specific article. I could always picture the cover that a specific article was in (though I'd then have to find where that magazine was), but once removed from the intact magazine the filing system is far more vague. Have to remember what file folder I saved it in, and then dig out the file folder.

You should be able find one in just about any ARRL Handbook that's
been printed over the last 30 years, or so. It's always in the section
on test equipment.

The best thing you can do is obtain the spec sheet. Point your web browser
at httt://www.questlink.com and do a "Product Search" on "LM338". If
you select the one from National you can get a very nice spec sheet with
lots of application information.

The spec sheets are in PDF format. If you have a problem obtaining it
or reading let me know. I can convert it to another format and email
it to you.

442. PIC-based repeater controller designs?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-17 00:00:00 UTC
From: john.ackermann@daytonOH.ncr.com
Message-ID: <eCXoZ9Xs9GA.203@rpc1284.daytonoh.ncr.com>

Anyone know of published designs to use a PIC microcontroller as the basis of a repeater controller? Seems like an ideal application -- just the controller plus a bit of audio control circuitry -- but since I've never done any development with these beasties I'd like to work from a published design.

Thanks,

John N8UR

I think there was one in QEX a while back. I have a program I acquired from somewhere which is a repeater ID'er, written by W9XT. I can send a copy of the assembly-language file (and the hex file too if you don't have an assembler, although MPASM assembler is free for downloading from the Microchip website www.microchip.com) to anyone who wants it.

I've been playing with various PIC devices for a few weeks now. I built a CW VHF beacon ID'er with a PIC12C509 which has to be the world's smallest beacon ID (one 8-pin DIP chip, one optional 78L05 if there isn't a separate 5 volt source, one resistor and one transistor for keying.) I'm working on a keyer using the 12C509 at the moment.

I'm just starting to explore the possibilities of the 16C7X series of devices, which have on-chip A/D converters.

Have you ever wanted to make a contact with a famous ham, but that
ham was a silent key? (You know, dead?) Well, your worries are over! Madame
Gozonga, a world famous medium, (some say she's an extra large, but that's
beside the point) will be operating special event station W1AW while in
touch with the departed spirit of Hiram Percy Maxim, on Labor Day,
September 7, 1998, 0000-2400z. Madame Gozonga's credentials are well
know to movie stars and other celebrities, as well as federal, state,
and local law enforcement offcials. She was carefully selected at
random from the many phychics who advertise in the classifieds of Weekly
World News, and other fine publications.
The ARRL has designed a special certificate to commemorate this historic
event. The logo on the certificate will be a silent key. Operating
frequencies will be 25 khz up from the bottom portion of the general phone
and cw segments of each band, simultaneously.

To make contact, tune into the frequency and repeat the following phrase,
followed by your callsign.

Oh-wah,
Tah-nah,
Sy-am.

Keep repeating the phrase, followed by your callsign, until you are
acknowledged. You will then receive a lovely 8 1/2" x 11" certificate,
suitable for framing, or kindling, or whatever else you want to do with it.
Please to not send any QSLs to W1AW. Your callsign will be acknowledged and
noted on the log, and you will get yours. Please allow 10 to 15 years for
delivery.

The best I know is a tranverter. (i''l insulting people by
explaining in case the term is not understood)
A tranverter is a device that uses an existing rig as an IF
and produces an output on the desired freq range.

Most tranverters I ahve seen satrt with a 10M sig, some use 2M
(not sure which are aound for 900Mhz right off

http://downeastmicrowave.com/
http://www.shfmicro.com/

There links if remmeber right in coping them that leads to
Kits for such tranverters

http://www.arrl.org/tis/info/kits.html

If I have reaaly blown try the above, and read for the
descritions looking for those mentioning tranverters

If you don't particularly care about a really classy setup, try a regular 365 pf tuning cap from an old transistor radio. A 8 inch length of 1 1/2" PVC makes a good form... wind it with #20 or so copper wire, spaced just far enough apart to allow alligator clip connction. A slot about 1/2" wide running the length of the pipe makes a good place to tap the coil with alligator clips. Scrape the enamel insulation off at the tap points if you use enameled wire. Bare copper works fine. This ought to give you around 50 uh... nearly twice what many L tuners use. You may find that the cap has about 6 contacts on it... you will have to experiment with the hookup. You probably have a dual gang cap... use one gang. two in parallel, or two in series for different ranges. Reg Edwards has some progs at his site that are handy for calculations of the coil, but really you can jusst cut and try. Reg's URL is:

http://www.btinternet.com/~g4fgq.regp

and there are some other progs you might find useful for antenna loading coils, loop antennas, etc.

If you are going with top shelf components, go with anywhere between 30 and 50 uH, and around 300 pf, and optionally you can include a smaller cap in parallel with the big one for fine adjust. That ought to give you a usable unit.

Hello Robinson, you're fine it seems. How's Man-Friday doing these days?

Thanks very much for publicising my website. There's one program which is straight up Bob's street -

It is program ENDFEED which, in addition to predicting the performance of almost any random longwire with a variety of ground systems, also calculates the component values of 3 types of antenna tuner at any reasonable operating frequency. The maximum values of L and C settings will give Bob an excellent idea of what values of components to obtain. Whether he bothers to put them into a box is up to him. He will probably find that even before the parts get into a box or case, that particular experiment has ended and he is busy making parts for the next !

Agreed - genuine radio enthusiasts ALWAYS wind their own coils. Around 1935 I also made my own variable air-spaced tuning "condenser".

Howdy fellow homebrew groupies! Excuse my canned attachment that I wrote-up to post on my local ISP's message board about some very POWERFUL commercial software I found to (at its simplest) aid in surfing the web -but it goes beyond that task. This is a very cool surf and launch application that does a SPLENDID job of organizing your thoughts (well mine anyways). My words don't do it justice, and the URL's to the on-line VIDEO TOURS will paint a better picture. You NEED to download and play with the DEMO PROGRAM (that's all I am using) to appreciate this little gem. Its a highly ADDICTIVE, FUN, and PRODUCTIVE way to squeeze the most out of your computer. I am posting it for my fellow ham comrades as I haven't seen much about this on USENET, and the word needs to be spread. I am NOT CONNECTED with this software/company in ANY WAY! Just a satisfied user that can see its potential (how about a BRAIN based OS in a PALMTOP?).

Check it out, cheers and 73..

Bill-WB9BBC

--
NATRIFICIAL's BRAIN Software wants to digitize your brain to use the THOUGHT processes in your own BRAIN to manage a wide variety of information into a single structure. Think of how your 'real' brain works on a variety of sights/smells/sounds and how it can freely associate and connect patterns -this software allows this same free association of ideas, documents, web bookmarks, notes and OTHER BRAINS. The BRAIN software transforms your computer into the digital version of how your mind works. Your computer becomes a THOUGHT PROCESSOR as it ties these diverse elements into a single THOUGHT data format. Read the press releases to get a better understanding of the technology, then watch the quick
tour and online tutorials (very well done). Then download and get your own BRAIN and put it to
work! The possibilities are endless here, and the ability to tap into a world of OTHER BRAINS
via the web in their THINKTANK is a powerful use of your BRAIN. So, GET A BRAIN of your own and expand your mind!

For THE BRAIN home page:
http://www.thebrain.com/

For THE BRAIN press releases and reviews:
http://www.thebrain.com/Company/press_01.html

For THE BRAIN version 1.51 30-day demo program (2.2MB download
for WIN95/98/NT - requires PENTIUM class machine):
http://www.thebrain.com/Brain/download.asp

For THE BRAIN quick tour (requires REALPLAYER 5.0):
http://www.thebrain.com/tour_01.html

For THE BRAIN on-line tutorial (requires REALPLAYER 5.0):
http://www.thebrain.com/Support/tutorial.html

For THE BRAIN's THINKTANK to other BRAINS (nearly 300):
http://brains.thebrain.com/

These are from a large collection of radio, boradcasting, amateur books.

All prices include shipping to CONUS.

Digital Logic Handbook, Digital equipment Corp. "Flip Chip Modules",
1968 edition, C-105. 486 pages, very good condition. $7.00

Digital Logic Handbook, Digital Equipment Corp., 1976-77, "Logic
Handbook", nearly 500 pages. Includes pricelist for parts! Very good
condition. $7.00

RCA Solid State databook - Linear Integrated Circuits and MOS Devices.
1973. 720 pages with cross references. Very good condition. $10.00

Sprague Integrated Circuits databook WR-502, 1982. Over 500 pages of
info. Very good condition. $10.00

Again, prices include shipping. I have many other books to sell - look
for my posts here or on e-bay.

what kind of soldering iron are you using, ie.. 5w,15w,35w, or 100w.
also what kind of solder are you using ie..60/40, silver solder
if you are using say a 100w iron with silver solder then yes it would be
a good ideal to clamp an alligator clip to the leads you are soldering,
but if you are using a 15w iron with 60/40 lead solder there shouldnt be
a problem with heat dissapation

There was a time when this was common practice with transistors... I have usually never bothered. Just use good technique... a good hot iron, clean and well tinned, and go in there, get it done, and get that iron offa there when you got it. I don't like to solder more than one lead on one component at a time... I will do a lead on component A, one on component B, then C, D, and then hit another lead on A, then B, etc. This gives the part a chance to cool. Normally a component will get noticeably warm, sometimes even too hot to touch comfortably. Just do the best you can. If you want to heat sink something anyway, and don't have any purposely made heat sink pliers, a pair of narrow hemostats works pretty good for discrete components. I keep a couple of pairs handy for inserting or removing parts on busy circuit boards.

I use sockets rather sparingly. You are essentially adding lead length when you use a socket, and you are introducing mechanical contacts to complete a circuit instead of a good solder joint. When you don't need a socket, don't use one, especially with AF or RF parts. Most digital apps are no big deal IMHO. Also particularly sensitive or expensive chips might be used with a socket to prevent damage, or those you think will get toasted pretty soon. For these chips, consider gluing a homemade heatsink to the back of the chip to prolong its life expectancy.

Normally, you should be able to make a decent PC boaard solder joint in about 3 seconds. Most modern components can tolerate this fairly well. Work on your technique and try to get it down to under 2 seconds. The hotter your iron is, the quicker you can do the deed, so get at LEAST a 30 watt iron. More is better.

If your tip is getting et up, pull it. chuck it in your drill, and turn it down to a fresh point with a fine file or a stone. This will help you apply heat more precisely. Be sure and tin the tip right away after re-pointing. Spare tips are cheap, so have an extra one or two on hand, maybe shaped to different points for difficult to get at joints.

Also, a more concise subject line will get you more responses to questions. Lots of times I just delete stuff without reading If I have a backlog of posts to read, and posts with subject lines that don't tell me anything about the content often fall into a low priority category during triage. I have to assume that many other users of the newsgroup do something similar. I ALWAYS, due to the massive amount of spam I recieve, delete email without reading if the subject doesn't ring any bells.

Good luck and I hope this helps. Homebrewing Rules!

#Lets say you wanna make your own PC board without having to buy any
#kits.
#So you buy that green plastic board and drill holes into it , but how
#can you place the copper lines which carry the electricity itself ,
#on the PC board ?
#Please help me.
The way it usually works, is you buy a the board with copper on it,and remove the copper you don't need ,usually by marking an acid proof coating (called resist) where you
want copper,and placing the board into an etchant, which removes the exposed copper. You then clean off the resist,then drill holes.

You can get copper tape,and conductive pens/paint.

>
>
Yeah I notice ALL the tips I have bought in the last few years are plated, but
I point them up anyway when they get ate up. They do corrode quickly without
the plating, but I tin frequently and get "fair" mileage. I just hate to toss
them even if they are only a buck for two. Nevertheless your point that time
lost with extra tip care is worth the small expense of more tips is valid.
Mainly we are in agreement, that a tip in good condition with a shape suitable
for te work at hand is a must.

I didn't know that was iron... I thought it was nickel or something at least on
some of them.

BTW I am going back to work in a couple of days so I will be absent from the
group for a couple of months, so bye everybody.

Hi all;

Do not respond to me, I am posting this for a fellow ham (Ken
N5CM).
Reply to Ken directly via e-mail at (N5CM@AOL.COM)..... See Kens msg
below. He is trying to recreate his 1938 ham station and needs your help
finding the article's from QST etc as shown below. Thanks all, I would
love to see Ken get this thing built and on the air. He has been a ham
for 60 years. 73's Bob

Hi Gang,

Does anyone remember a transmitter oscillator circuit that appeared
way back in 1937 or 1938 which the author labeled a "Pull-Pull" circuit?

I thought it was in the Hints & Kinks section of QST but I must be
wrong.
Maybe it was in Radio Craft magazine or other radio publication.

The circuit resembled the "tuned plate-tuned grid" oscillator but, the
grid coil was wound in opposite direction over the plate coil, the
theory
being that any change in the plate circuit would be induced in the grid
circuit in opposite polarity - the two would pull in opposite directions
and
"lock" giving amazing stability.

I can vouch for the stability - without voltage regulation, on 20 meter
CW
I never got less than a T9x report which means pure dc note and the x
meant it sounded like a crystal controlled oscillator.

Also, I am trying to find the article about a two tube regenerative
receiver
described in QST I believe. It used a type 58 regen detector and a
type 56
audio amplifier. It was housed in a "Bud" black crackle finish cabinet.

I would like to build up these two items again as they were my first Ham
Station in the spring of 1938 when I was W5HHA.....

Any help greatly appreciated! 73, Ken.....N5CM.....

Source record: 81026

I was going to say something similar to Gary. My first irons were cheap
and crummy, but starting about 1974 or so I started to use the modular
irons (made by Ungar?) available from Radio Shack. The tips were iron
plated, and I don't recall needing to replace them much if at all. I did
break quite a few in the early days, when the irons would keep dropping on
the ground.

A couple of years ago, I bent or filed one of those tips for some reason,
to customize it. That tip started wearing out almost right away. öt
became like the tips in the crummy irons that I started with.

So I'd agree that those iron tipped tips don't need filing or anything
drastic to clean them, because while they collect junk that needs cleaning
with a damp sponge or paper towel, the tips themselves stay fresh. So
it's well worth getting iron-tipped tips. And if you do start filing away
at those tips, expect to continue to do so to combat the ongoing
corrosion.

Michael VE2BVW

Hi all, and thanks for reading this

The South side Amateur Radio Society Inc. (VK4WSS) now has its own web site (Sort of anyway, its my site but I donated what I didn't use).

The site is new and I am an amateur at web site authoring, so please take a look and let me know what you think. Constructive criticisms and link page additions are welcome.

I have published that club news letter on this site as well this can be viewed on line or downloaded as a zip file (140k). You may use any story you like from the newsletter, but PLEASE acknowledge where you got it from. Exchange news letters are welcome.

Additions and updates will be made on a regular basis including VK4YE Chris Kilowatt linear project.

Regards
Adam Jaroszuk (VK4LAJ)

Most tips today are iron plated, and turning or filing them down will
remove the plating. After you do that, you have to nearly constantly
clean and tin the tip or it will rapidly corrode and you'll be unable to
make good solder joints. It usually isn't worth the trouble. Replace
worn or damaged tips with new ones.

A quick wipe across a damp sponge every now and again while
you're working is all an iron plated tip needs. But one that's had
the plating removed must be cleaned aggressively and tinned
frequently. That breaks the rhythm of your work. The time you
lose will quickly justify the expense of a new tip.

I designed an amplifier and wanted to make it a tuned amplifier (for 3.5Mhz). I added an LC circuit at the output so that I can get this frequency... This approach seems not to be working (I did simulation to verify). Any idea how to make it tuned..the amplifier is a common emitter BJT amp.

help is appreciated
thanx
Neb
p.s. is there any place on the web where I can find a tuned amplifier circuit (with a transistor that I can easily find in shops)

Udi:

At the risk of being a victim of what is otherwise a perfect troll, the PC or printed circuit board material is fiberglass with a thin sheet of copper attached to the surface, you then use different products such as ink pens, stickers, iron on type materials etc to create the patteren of 'copper lines' that you want. The rest of the copper on the board is removed using an etchant that disolves any copper that does not have a protective cover on it.

The 'copper lines' are created by removing unwanted copper, not laying the desired copper on the board.

Hamfest - Gaithersburg, MD - September 13

FARFest '98, the *last* Gaithersburg Hamfest, will be held
on Sunday, September 13, 1998 at the Montgomery County
Fairgrounds in Gaithersburg, Maryland.

Gates open at 6:00 am.

Take I-270 to exit 11 northwest of Washington, DC. Follow
the signs to the Fairgrounds (Montgomery County Agricultural
Center).

Talk-in on 146.955(-) MHz.

Special event station W3PRL-AM (Rock XV) on 3885 and 7290 kHz.

Admission $5. Tailgating $15.

All proceeds go toward the support and administration of the
57+ educational scholarships that are funded and supported
by the Foundation for Amateur Radio (FAR).

For more info, contact:

Al Brown (KZ3AB) at 301-490-3188, or
Mary Morris (N4TCI) at 703-971-3905, or
e-mail at Amateur_Radio@hotmail.com

In 1999, FARFest is moving to Bowie, Maryland.

Hmmm for a second there I thought my younger brother Brad from Ohio had taken an interest in radio. Brad if you look at the specs most of the components can take several hundred degrees for several seconds, I have never heat sunk a part while soldering.

Specifically with chips though, I will usually solder pin 1 and then the first pin on the other side. then individually solder each pin allowing a few seconds in between for cooling. Remember that tinning the leads of the components first, and having a nice steel wool cleaned PC board will the solder to flow quickly and make a solid electrical connection in fractions of a second. The more dirt and grime the long you must heat the part to get the solder to flow. That W1FB book is a real winner in my opinion.

What Tim said, but actually there used to be someone making
self-adhesive copper pads and strips. I don't remember a
company name. They were kind of klutzy and hard to work with.

Don:

Ten Tec has a kit, but I suspect your interested in homebrewing your own. Depending on your skill level, I might suggest not building the reciever part but starting off with a simple converter, if you build one with an IF of 1MHz you can listen to shortwave on a standard AM radio, this technique works all the way up through VHF frequencys. The W1FB qrp notebook has some constuction articles on converters with an IF of 1.8 MHz in the 160m band these could EASILY be converted for use on .5 to 1.6 MHz in the middle of the AM broadcast band. This is the basis for building a General coverage reciever anyway, the only differnce is the next project you build is the reciever at 160m.

Hi Ron OM,

Switching power supplies being very popular today, there is a lot of published material on their design. One book I can recommend is Abraham Pressman's "Switching Power Supply Design". Published by SwitchTronics, Waban Mass (his company). He covers the popular topologies, design equations, including magnetics design and core selection, etc. For high voltages, the main challenge is to construct the transformer properly with inter-layer and inter-winding insulation to avoid breakdown between the windings themselves and to the core.
A few years ago in QST there was an excellent article on a KW switchmode power supply to run off rectified AC line voltage. That design could be modified to run off 12V DC as in a car. If you wanted to have a full KW, keep in mind how many amps that takes at 12V! For example, assuming 85 percent efficiency at full load from the power supply, then for an output of 1000 watts, it requires 1000/.85 or 1180 watts. At 12 VDC input, that is 98 amps. The peak current requirement will be much higher, of course. The power supply transformer, output rectifiers, and input switching devices will be where the extra 180 watts will be dissipated, so you have to provide sufficient cooling for those parts.
Also, try Motorola's web page for devices useful and application circuits for swithmode power supplies. They make many power mosfets designed for switching power supply applications.

Hi, everybody,

What household cleaner will remove very gummy adhesive from an acrylic sheet without damaging the acrylic? I tried soaking in warm soapy water but, predictably, that had absolutely no effect.

By "household cleaner" I mean something I might find in my cabinet or at the local hardware store as opposed to some esoteric chemical I may need an environmental impact report to use.

The acrylic is blue (not clear) but I'm sure that has no bearing on the solution.

R,

Al W6LX

Spray it with WD-40 and all glue will wipe off and not hurt plastic.

Thanks, I'll check out ten tec, but unless they have changed from 10
years ago, I probably cant afford their products. Also, Im wondering if
it is worth trying to use an AM radio. Wouldnt there be quite a bit of
rework to add demodulators for sideband? I could use my colins receiver
for the IF, but I want something that is more portable than the old
boatanchor. It doesnt have to be battery operated, but that would be a
plus.

The best stuff Ive ever used is called "GOO GONE". I got it at Home depot. Its made just for removing the adhesive that stickers and so forth leave. Put a drop or 2 on and let it soak. then put some more on and gently rub it. Almost every thing I used it on came of much quiker than anything I ever tried including lighter fluid, alcohols, even MEK(which will destroy acrylic and your liver too). Ive used it on acrylic and it worked fine, but anything youve not used it on should be tested of course, particularly if it is of great value.
Good luck

I have a fifty or seventy five amp transformer that I would be willing to get rid of. It's new except for being used to burn a few traces off a circuit board. If it's not too heavy for you, I'll look and see if I can find it.

Have about 40 used 6 and 7AH 12 VDC gel cells for sale.
All load tested good. PERFECT for QRP rigs
and portable operation. I have sold hundreds of these to the QRP boy's
on the QRP mailing list and all have been very satisfied. Had a few
damaged in shipping and one came back DOA which I replaced for the
fellow free of charge but that's it. I am the service manager for an
alarm company and we change our customers batteries every 3-4 years as
preventive maintenance. These used cells should provide another 2 to 3
and probably longer service if used and recharged properly. Cells come
fully charged and are ready to go. They can be recharged with a simple
wall wart charger available at Radio Shack or a 1 amp automotive
charger. I guarantee against DOA.
Brands are Yuasa, Interstate, Radionics and Portalac.

6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

Images of the cells can be seen at:

http://www.usol.com/~tje/yuasa6.jpg Yuasa 6ah

Hi,
I have a couple of serially programmable DDS boards, the latest one
is an AD9850 running at 125MHz. The spurious outputs from the AD9850 are
typically -70dBc, good enough for a hobby HF receiver.
However, the output will go 'only' up to 55MHz. I doubt that you will
find a readily available DDS that covers VHF directly.
For VHF, one option is to drive a VHF PLL using a DDS reference, this
also cleans up the low level spurious outputs from the DDS.
I also believe that a separate DDS board, carefully laid out, driven
from an external MCU is better/cleaner than a combo MCU/DDS VFO.

Cheers,

Tibor Bece

I would like to sell two solid state HF amp boards, labeled: Technicare 600 watt amp. They have been tested by the fellow I acquired them from at 450 watts (each board) key down for a few moments (they need much larger heat sinls and a couple of resistors upgraded before they may sustain that sort of power).
I have gathered information as to sources of splitter-combiners and output filters which will work if one chose to combine two of these for a full power+ HF amp. I also have a full set of replacement finals (Acrian S200-50).
Asking $325. shipped conus for the pair of boards and the four replacement finals. -- 73, DavidC AA1FA E-mail or call 603-894-1174

527. Re: Anyone know a way to make a rotator that rotates the whole (tubular) mast ?

Go to your local industrial supply company, look under power transmission in the Yellow pages, there you can buy flange bearing sets designed to support hundreds of pounds build them into a tripod and couple the ground based rotor to the shaft, the bearings will carry all the weight. The flange bearing sits on the ground but you'll need others wherever the rotating pole comes into contact with the tripod. A simple 1/8 hp gearmotor with chain and sprocket should be more than enough to rotate the fixture.

This might sound silly, but I have used Heinz white vinegar to clean
adhesive off of wine bottles, meter faces, and even watch crystals. For
tougher stuff, I have used a presoaked pad with petroleum naptha.

The best I know is a tranverter. (i''l insulting people by
explaining in case the term is not understood)
A tranverter is a device that uses an existing rig as an IF
and produces an output on the desired freq range.

Most tranverters I ahve seen satrt with a 10M sig, some use 2M
(not sure which are aound for 900Mhz right off

http://downeastmicrowave.com/
http://www.shfmicro.com/

There links if remmeber right in coping them that leads to
Kits for such tranverters

http://www.arrl.org/tis/info/kits.html

If I have reaaly blown try the above, and read for the
descritions looking for those mentioning tranverters

Subject: Cap & Coil Question

Hello Robinson, you're fine it seems. How's Man-Friday doing these days?

Thanks very much for publicising my website. There's one program which is straight up Bob's street -

It is program ENDFEED which, in addition to predicting the performance of almost any random longwire with a variety of ground systems, also calculates the component values of 3 types of antenna tuner at any reasonable operating frequency. The maximum values of L and C settings will give Bob an excellent idea of what values of components to obtain. Whether he bothers to put them into a box is up to him. He will probably find that even before the parts get into a box or case, that particular experiment has ended and he is busy making parts for the next !

Agreed - genuine radio enthusiasts ALWAYS wind their own coils. Around 1935 I also made my own variable air-spaced tuning "condenser".

Subject: Cleaning Acrylic

Hello Al,

You might try lighter fluid BUT test it on a small spot first. Also, WD-40
or
mineral spirits may be useful BUT test first.

Good luck and let us know what works best for you.

Hi,
I have a couple of serially programmable DDS boards, the latest one
is an AD9850 running at 125MHz. The spurious outputs from the AD9850 are
typically -70dBc, good enough for a hobby HF receiver.
However, the output will go 'only' up to 55MHz. I doubt that you will
find a readily available DDS that covers VHF directly.
For VHF, one option is to drive a VHF PLL using a DDS reference, this
also cleans up the low level spurious outputs from the DDS.
I also believe that a separate DDS board, carefully laid out, driven
from an external MCU is better/cleaner than a combo MCU/DDS VFO.

Cheers,

Tibor Bece

Of course! When my 4th grade classroom first set up their individual web
pages they used a ton a high res images.
It didn't take them long to realize that nobody, including their parents,
wanted to sit there and wait for the images to load.

Subject: Fluxmeter for aurora warning

Another low-friction method is fluid suspension. I used this to determine if

pebbles or
rocks are slightly magnetic. Put the pebble on a plastic jar lid (inverted),

and float
it in a plastic bowl of water. Then hold a strong magnet near it and see if
the boat
moves. If the magnet is floated, this makes a good compass.

Another method is AC eddy current magnetic bearing suspension. Wind a coil
of
close-
wound turns like a hoop and mount it horizontally with some space between it

and the
table-top. Construct a power oscillator circuit using the coil in parallel
with a
capacitor to form a resonant circuit. Choose the number of turns and
oscillator frequency
to maximize field strength while having a shallow skin-depth of penetration
into the
thickness of copper that the suspension cone will be made from. Make a bowl
or cone out
of sheet copper and "float" it on the AC field of the coil. Now you can
place
magnetic
objects on an almost frictionless bearing. To do the job right, place the
contraption
in a vacuum. With a spherical container used instead of a cone, and with
another
identical coil above the sphere, a 3-D orientable contraption is possible.

Subject: fs: Solid state HF amp boards

I would like to sell two solid state HF amp boards, labeled: Technicare 600 watt amp. They have been tested by the fellow I acquired them from at 450 watts (each board) key down for a few moments (they need much larger heat sinls and a couple of resistors upgraded before they may sustain that sort of power).
I have gathered information as to sources of splitter-combiners and output filters which will work if one chose to combine two of these for a full power+ HF amp. I also have a full set of replacement finals (Acrian S200-50).
Asking $325. shipped conus for the pair of boards and the four replacement

finals. -- 73, DavidC AA1FA E-mail or call 603-894-1174

Udi:

At the risk of being a victim of what is otherwise a perfect troll, the PC
or printed circuit board material is fiberglass with a thin sheet of copper
attached to the surface, you then use different products such as ink pens,
stickers, iron on type materials etc to create the patteren of 'copper
lines' that you want. The rest of the copper on the board is removed using
an etchant that disolves any copper that does not have a protective cover
on it.

The 'copper lines' are created by removing unwanted copper, not laying the
desired copper on the board.

This is real. Just went to arrl web page. All Novices and Tech + to
become Generals in essence if this goes through.

ARRL Proposes Simplified Amateur License Structure

The ARRL Board has agreed to propose a simplified Amateur Radio
licensing
structure with four classes. Lengthy discussion and
debate during the Board's meeting July 16-18 led to majority support for
a plan
for four written examination elements to establish
amateurs' operational and technical qualifications instead of the
present five,
and two Morse code examination elements instead of
the present three.

Under the plan adopted by the Board, the entry level to Amateur Radio
would be
known as Class D and would convey the
privileges of the present Technician license. The written examination
would be at
the same level of difficulty as that of the present
Technician examination, but consistent with the privileges of the
license. All
amateurs now licensed as Technicians would become
Class D.

The next step would be known as Class C and would convey the privileges
of the
present General license, but with phone
subbands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40
meters. Class
C would be the entry level to high
frequency (HF) operating privileges. To upgrade from Class D to Class C,
an
amateur would pass a written examination on the
operational and technical qualifications required for HF operation and a
5 word
per minute Morse code examination. All amateurs
now licensed as General, Technician Plus, and Novice would become Class
C. The
expansion of the telephony sub-bands would
result from "refarming" of the Novice CW bands that are no longer
required for
their original purpose.

The third step would be known as Class B and would convey the privileges of the present Advanced license, but with phone subands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. To upgrade from Class C to Class B, an amateur would pass a more advanced written examination similar in difficulty to the present Element 4A and a 12 word per minute Morse code examination. All amateurs now licensed as Advanced would become Class B.

The final step would be known as Class A and would convey the full privileges of the present Amateur Extra Class, with telephony sub-bands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. To upgrade from Class B to Class A, an amateur would be required to pass the most difficult written examination in the sequence. Consistent with the practice in many other countries, no additional Morse code examination would be required beyond 12 words per minute. All amateurs presently licensed as Amateur Extra Class would become Class A.

In their discussions, Board members emphasized that the objective is to rationalize and simplify the amateur licensing structure without reducing the requirements for any class of license. Where reductions in Morse code requirements are proposed, there would be a corresponding increase in written examination standards. On the other hand, Board members were adamant that simplifying the structure should not come at the expense of privileges already earned by amateurs. Therefore, present Novice and Technician Plus licensees, having earned entry-level HF operating privileges, would be granted the new entry-level HF license.

Adoption of the simplification plan marks the culmination of 30 months of work by the Board, during which time the input of literally thousands of ARRL members and other amateurs and prospective amateurs was considered. The Board debated a wide variety of options including both smaller and larger numbers of license classes, higher and lower qualification levels, and different privileges. Nine of the 15 Directors voted in favor of the plan, with six opposed.

Following the meeting ARRL President Rod
Stafford, W6ROD, observed, "The debate was at times contentious and the result was
not unanimous. Some Board members
preferred greater simplification; others were uncomfortable with some of the
changes being proposed. However, every Board
member, without exception, left the meeting knowing that each of his or her
colleagues did what they believe is best for the future
of Amateur Radio."

Members are urged to contact their ARRL directors to comment on this proposal.
E-mail addresses are on page 10 of any issue of
QST. Members also may comment on the proposal via the ARRLWeb site,
http://www.arrl.org or via e-mail at restrux@arrl.org.

it is some external bias resistors possible to use with one type, but
without those either 3101J or 3105 will work, I used them with a douzen
of TNC2C-OZ and TNC2C-DL on 1200baud, with higher xtal frequency some
amateurs reports having succesfully operated 2400bps

Believe the ICs have not been in production since 1996, but I have seen
notes claiming that they are still easy to buy in small quantities.....

Have about 50 used 6 and 7AH 12 VDC gel cells for sale. Also have about 3 4AH 12 VDC cells. All load tested good. PERFECT for QRP rigs and portable operation. I have sold hundreds of these to the QRP boy's on the QRP mailing list and all have been very satisfied. Had a few damaged in shipping and one came back DOA which I replaced for the fellow free of charge but that's it. I am the service manager for an alarm company and we change our customers batteries every 3 years as preventive maintenance. These used cells should provide another 2 to 3 and probably longer service if used and recharged properly. Cells come fully charged and are ready to go. They can be recharged with a simple wall wart charger available at Radio Shack or a 1 amp automotive charger. I guarantee against DOA.
Brands are Yuasa, Interstate, Radionics and Portalac.

4 ah cells are $8 shipped CONUS
6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

Images of the cells can be seen at:

NO, no, no. When you take two 50 ohm filters and hook them up in PARALLEL you will get 25 Ohms. The input impedence of the two filters have to be 100 ohms so that when you connect them up they result in the 50 ohm.

Not quite true !?!
When the filter is out of passband it shows a high impedance, so
infact two filters with substancial different passbands will work.
BUT, for best results one usually makes some adjustments to the input
of the two filters to acheive the best result.

I usually design the LPF with an series inductor as first element and
the HPF with a series capacitor. These two components will interact
and need to be adjusted, I do this in an rf-simulation program to get
the best performance.

Try Almond the free simulation program....

And Generals would get a really raw deal. Not only would we lose
spectrum space and have it flooded with low-code newbies, but the
13wpm that we worked so hard for would be thrown out the window
and we would only get credit for 5.

It appears to me that this proposal is designed to be good for ARRL
(attract more members, sell more books), but not necessarily good
for amateur radio in general, as the quality of the hobby on the HF
bands is likely to go to hell.

I'm mad as hell, and I gave ARRL an earful of what I think about their
stupid proposal. I strongly recommend all hams do the same.

Hi Al,

I use Ronsen lighter fluid when I want to clean plastics of old adhesive or oil... Naptha obtained from the hardware store for paint purposes about the same thing but test first. Lighter fluid is a great pre-cleaner when you want to glue surfaces together. Takes off the oil films and insures a good bond.

So spend a few hours and upgrade to Advanced (or Class B in the new
scheme). Do it before the new scheme goes into effect and you'll
guarantee yourself credit for the code you've already "worked so
hard for." Plus you'll get increased spectrum and plenty of room to
hide from those "low code newbies"

(Slightly unrelated: I don't understand why every General class op
hasn't upgraded to Advanced. Sure it's a more difficult test, but a
few hours an evening for a couple of weeks and you're there....)

For that matter, why not spend another few hours and upgrade to Class
A under the new scheme? No additional code is required and you get
all the spectrum there is.

Regarding the morse code credit, I quote from the ARRL's web site:

>Board members were adamant that simplifying
>the structure should not come at the expense
>of privileges already earned by amateurs

I think that makes it pretty clear that you won't lose credit for your
13wpm code - but you'll still have to take a written test to upgrade,
just like you do now from General to Advanced.

>the quality of the hobby on the HF bands is likely to go to hell.

It's already there. Listen to the 75m General phone band some night
and you'll see what I mean. "Low code newbies" aren't the problem.
Redneck hicks with closed minds and too much alcohol are.

I read the proposal and it sounds perfectly acceptable to me (as an
Advanced operator) and I would think it could do nothing but benefit
the Amateur Radio Service as more people are given HF operating
privileges. In the long run, most operators who currently have HF
privileges are going to be unaffected by the change, and many will
benefit from added spectrum and reduced licensing requirements
(Advanced operators, for example, gain spectrum and don't have to do
20 wpm code to upgrade to the next higher level)

I agree that every amateur should let the ARRL know how they feel. But I also think that before you fire off a nasty e-mail to the ARRL, you should think about what the proposal really means and what impact it's really going to have, which isn't that much. If the hobby is to survive into the next century, it certainly requires this sort of change.

Read the proposal again.

Class C operators (General, Novice and Tech+) would *gain* spectrum on
80, 40 and 15 phone. 20 and 10 would remain unchanged.

True, some CW spectrum would be lost, but it's at the top end of the
subband where the existing Novice operators work so it's no great
loss.

Class C ops will get an additional 50 kHz on 75 and 15 phone, and 25
kHz on 40m phone. Not a bad deal.

Hello--
According to "Tube Lore" it's similar to a UX-CV11 or 211H; the UX-CV11 differs in its base design but is similr to an HY-51A, 322, or T841W.
Hope this helps--

Rick,

All generals SHOULD get credit for 13, that is, 12 WPM if this is approved. That way, you would at least be closer to Extra (Class A), if you wanted to go that far. I cannot believe that a general class license holder would have to pass a 12 WPM test after having previously passed a 13 WPM exam!!!

I'll bet this point will be clarified soon.

Regards,

Bill

It is interesting that Yaesu will not support the FT-107. They told a friend of mine that they don't have the IC that drives the display, and they wouldn't tell him who they got it from so he could go to the source .. nice, huh?

The display may be repaired, but in the face of the recalcitrance of Yaesu, one would have to replace the driver IC with several discrete components ... probably what my friend will do. I wonder what they did wrong to have an IC that just dies in so many of their FT-107 rigs - poor design that allows power surges or leaky internal RF to get to it?

If you have a trashed FT-107 with a properly functioning display, he is looking! It would have to be under $75. and that's a lot for an IC!

You are right in several areas:
The display chip in the 107, also used in a couple of
other Yaesu rigs, well, to put it plainly, sucked.
Yaesu knew this. But when the IC was discontinued,
they had two options:
1) Buy the remaining stock so they could support
their customers,
2) Ignore it, and tell their customers they were screwed.

Gess which option they chose.

Anyway, I'm currently in the breadboard stage of
a replacement counter board. I hope to have this available
in September. Other versions will follow.

Ahhh heck, REAL HF operators don't need no stinkin' memories or
digital readout. As long as it puts out power with a CW key that's all
that matters !!! :)

I may not be a ham yet (taking 3A in 3 weeks) but in my opinion it is
necessary to do this, or young people like myself will be pushed away
from the hobby, you Generals can move up to the next letter-designated
class. We must move on......

Hi,

can anyone give me some information about the spectrum analyzer circuit
published in QST 8/98?

Principle of operation (double conversion/direct down conversion)?
Frequency range?
Dynamic range?
Type of mixers and filters used?

QST is hard to get here.

Thanks

Peter

==========
The proposals are a step forward to attract more young people to the HOBBY.
Is it really worth complaining just because ,in order to get a
General class level licence ,the new generation now only has to read
5 instead of 12 wpm morse code ?
Morse is no longer the PRIME mode of ham radio operation inspite of
being rf power efficient and enjoyed by many including myself. 5
wpm shows the licensee 'has knowledge of morse',that's all the ITU is
currently requiring ..... perhaps after 2002 no longer.

It is only a pity that like similar organisations in other countries
the League is still so divided ,eg for=9 /against=6.
The 'Old Guard' still finds it difficult to accept that " the only
constant factor in life is change" .

But at least the first step to move forward has been made.....I am
sure for the benefit of amateur radio. Congrats !

566. documentation power measuring kit

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-22 00:00:00 UTC
From: Eric Post <post@iaehv.nl>
Message-ID: <35B6B508.3A83@iaehv.nl>
Source record: 80973

Hello,

today I bought a old army/navy ? power measering kit.
It's called : power measuring kit, summation bridge MX-1309/URM-23.
Is't a grey box with 4 long attenuators 3,6,10 and 20 dB. The 20 dB
attenuator is divided in two pieces. It has also an adapter connector
and a bolometer RF DT-76/U.

I have a few questions about it :
What power can it handle ?
Does anyone has documentation about it ?
Does anyone has the documentation / schematics of the reading-unit (that
I dont have) or is there a amateur who has build a unit to use this
bolometer.

Please reactions by email, thanks a lot.

568. Re: Idea for simple 18 MHz QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-22 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <35b64cc6.0@newshost.pcug.org.au>
Source record: 80975

I tried a 27.125 MHz crystal last night and tested its frequency. On its second harmonic I could get 18.080 - 18.090 MHz in a non-optimised VXO circuit. This is right in the middle of the CW part of the band, and would be ideal for a QRP rig.

The significance of this is that 27.125 MHz is a very common transmit freq in 27 MHz CB handhelds. Many people will have one or two lying around. If you do, you'll be able to get active on another band without spending any extra on crrystals.

A 27.145 MHz xtal was a little high in frequency, but still probably OK for CW. A bigger VXO coil may be able to shift the coverage down a bit. A 27.095 MHz xtal was a bit low and only covered the bottom couple of kHz of the band (the rest of the range being pirate territory).

And, contrary to popular opinion, 27 MHz crystals are 3rd overtone and not fundamental on 27 MHz. Thus they oscillate in the 9 MHz range - easily doubled to 18 MHz.

And, another thing - if DSB or AM is more your style, 27.240 MHz xtals
will cover a part of the phone segmwent on 17 metres.

Look at some of the DUCO glue type products, I know one of them is
polystyrene.
You need to mix it with some acetone to use it.
Also you can melt Styrofoam in acetone and make a good Q dope.

First, you always used to (I don't think it's changed) be able to get back issues from the ARRL. If they no longer had the specific issue, they would photocopy the specific article for something like a dollar a page. YOu might try contacting them to see if they have any special mechanism for overseas hams. Check out their website at http://www.arrl.org

The issue showed up at the newsstand today. I saw your message earlier, and when I went out, there was the issue. I glanced at it, and I intend to get the issue because of the article.

It's by Wes Hayward and someone else. It's sort of a return to a serious spectrum analyzer. It's not ultra-complicated, but it's not the ultra-simple ones we've seen a lot of in recent years, with tv tuners as front-ends, and quite wide IF strips.

It's double conversion, to 110 MHz and then down to a lower IF. I didn't notice the second IF frequency; there was a section that had an LC filter for wide, and a block representing a crystal filter for narrow, with some comments about this in the text. I didn't take note of the tuning range. There were some Mini-Circuits parts, which I didn't recognize but assumed to be double-balanced mixers. The IF was an MC3356, but with comments about using something better.

I'd say it's a serious attempt, and as it said at the beginning of the article, it cut out the features to make it cheaper and simpler, not the performance. I would hope it makes its way into furture editions of the Handbook.

One of the better spectrum analyzers I've seen described in the ham magazines was in Ham Radio Magazine back in 1977, by Wayne Ryder. I forget the month. It was a good introduction to the topic, and covered something like 0-100MHz, which at the time was quite good. Similar projects at the time or before would cover a single ham band at a time. It used discrete components, and had a good sharp IF with logarithmic response. I'd say it's still a good introduction. Since that article, we've seen a lot of wide-band spectrum analyzers, mostly due to the use of tv tuners as front-ends, which do have limitations. I've seen some horribly simple units that might be considered little more than a scanner with variable voltage tuning rather than synthesized tuning. I've also seen some that were quite complicated, but did nothing to improve on the selectivity (and the one I'm thinking of, in Radio Electronics that's had some other similar projects, used a lot of IC's that might be difficult for average ham to get ahold of).

I think the one in QST this month is a step forward, to consolidate the recent designs that have improved on dynamic range, but to improve the IF strip and the front end. Like all good things, it's not the end of the line, but if someone is interested in the topic it's probably a worthwhile article to have.

By the way, there is a continuation planned for next month. I can't remember what it's to cover, but the complete unit is described in the present article.

Just look at the August QST in the little section called FIFTY YEARS AGO. The same cries were being made then. New hams are not building and CW as just a requirement to be gotten passed. Fifty years later and the same cry is being made.

Quit crying, the FCC will do what they want to, with or without ARRL's "guidance" and we have little say either.

The Europeans are moving towards a joint license structure having only two classes: HF and VHF (with and without code).

Our government is attempting to reduce regulatory clutter in many areas and well may look at some of the FCC's rules with an eye towards simplification. Fewer classes of amateur radio license would be simplification, as would fewer forms, and a smaller regulation book.

A change will happen, just hope it isn't another boondoggle like ARRL's Incentive Licensing of 1968.

I had a similar problem with the display chip in my FT707. I used a Radio Adventures Digital display. It took a fair bit of work, but now the Wayfarer is as good as new.

My chip failed on New Years Eve, 1996. When I called Yaesu in early 1997, they didn't have the chip, but I remember them really trying to help me.

Overall, I would say Yaesu has been excellent in their support of their older equipment, including FT102, FT757 and FT767. In *every* instance, they have provided parts and assistance. I was even able to get knobs for my FT707 and meter lamps for an FT102.

Yaesu has been *very* good on support of their (much) older equipment.

No complaints, and a hearty recommendation.

Hi Guys;
I have for sale a Johnson dual section Air Variable, 300uuf per section, rated
at 7000 volts, .175 air gap, Model Number 300-CD-70.
Length 18" x 5-1/2" wide, 1/4" shaft!
BRAND NEW, never used. Price is $50 plus shipping!
I have a .JPG pic for interested parties!

Marty Tippin wrote in message <35b4c829.75065558@news.supernews.net>...

>So spend a few hours and upgrade to Advanced (or Class B in the new
>scheme). Do it before the new scheme goes into effect and you'll
>*guarantee* yourself credit for the code you've already "worked so
>hard for."

Who do you think you are to tell me that I have to do additional work
to secure privileges I have already earned?

>Regarding the morse code credit, I quote from the ARRL's web site:
>
> >Board members were adamant that simplifying
> >the structure should not come at the expense
> >of privileges already earned by amateurs
>
>I think that makes it pretty clear that you won't lose credit for your
>13wpm code - but you'll still have to take a written test to upgrade,
>just like you do now from General to Advanced.

Quote all you want, the only thing that will matter in the end is what
gets signed into law, and the fact that they have lumped General,
Tech+, and Novice together at 5wpm speaks volumes. Don't try to
read in what you want to hear. Remember that politicians are involved.
They love it when people make that mistake.

>>the quality of the hobby on the HF bands is likely to go to hell.
>
>It's already there. Listen to the 75m General phone band some night
>and you'll see what I mean.

Your reasoning gets real fuzzy here. Somehow, the fact that we
already have a problem is supposed to prove that adding thousands
of inexperienced operators won't make things worse? I don't get it.
Maybe you should figure out where you were going with that idea?

Have you forgotten the quagmire that CB turned into when the FCC
reduced enforcement, then lowered standards, and finally eliminated
the license altogether? Do you not recognize that we are heading
down that same road?

>I read the proposal and it sounds perfectly acceptable to me (as an
>Advanced operator)

You're apparently not losing anything you care about. I am.

>I agree that every amateur should let the ARRL know how they feel.
>But I also think that before you fire off a nasty e-mail to the ARRL,
>you should think about what the proposal really means and what impact
>it's really going to have, which isn't that much. If the hobby is to
>survive into the next century, it certainly requires this sort of change.

Your reasoning gets fuzzy again here. Why would you assume that I
didn't think about it? Is it because you normally shoot off your mouth
without thinking and you just assume that everyone else does too, or is
it because you think that anyone that doesn't agree with you completely
is either just plain wrong or misunderstood the situation? Wake up!
You are not the only one entitled to an opinion.

As it happens, I have given a great deal of thought to it. I am in favor
of expanding the HF privileges of Tech+ type people who have displayed
the skills needed for responsible HF operation, but aside from that the
present licensing system works very well, and only needs to be simplified
a little, not radically changed. I believe the proposal does too little to
sustain the privileges of existing licensees who have earned their place
and gives too much away to an unknown quantity of potential newcomers
of uncertain quality. In other words, I think it's a foolish risk.

It's obviously going to have a huge effect on the future of amateur radio,
because it represents a significant lowering of standards. And where did
you get the idea that amateur radio was in any danger? We've just taken
on a huge crop of new licensees, and we're considering expanding their
HF privileges, which will probably attract more. Amateur radio is in the
best shape that I have ever seen, and I'm not ready to sell out, so take
your doom and gloom panic-mongering somewhere else.

Source record: 81109

No Name: (Why are you no name? Your question's ok, if you're serious about it.)

As Ralph below says: Dipoles ARE cheap and easy. They are efficient, too. A vertical inside-mounted 2m dipole costs you a piece of wood, some tape, a couple of cup hooks, 38" or so of most any wire, some sort of center insulator (use a piece of a 6-pack plastic thing), some solder, and some RG-8X or better to reach your transceiver, then a PL-239 connector. You can tape a 2m dipole to a garden stake and hang the thing from your attic rafter, like a bat. Selection depends on what you want to do with the antenna (selection of ANY antennna depends on that.). Go to R/S and get one of their discones and screw it tpgether. Get some 1/2" copper tubing and make a nice J-pole or get a roll-up J-pole from Antennas West or MFJ and just put it up somewhere. High would be nice. Get a mag mount and stick a mobile whip to your refrigerator. Use it for that 5 minutes a day when the kids aren't rummaging around inside. Put one on your BBQ when it's cold. Get a disguise antenna and mount it on your attic air vent.

All this stuff is easy. Some work better than others. Get metal in the air.

Be careful. Don't worship SWR. Don't use so much - or so crummy - coax you will be convinced by the SWR figure measured at the rig that you have a great antenna when in fact you may even have no antenna (example: 3 dB line loss to the antenna terminal is not that far if you use RG-58 at 2M or 440.. Now let's disconnect the antenna - or short it - and create an infinite SWR at that point, means 3 dB more line loss returning to the meter at your rig. Start out with 50W, lose 25 going, it ALL reflects from the antenna feed point, so you lose 12.5W more returning to the rig which means you started with 50, ended up with 12.5 watts for a forward to reflected power reading ratio of 100 to 12.5W, or 4 to 1, which equates to an SWR of 3 to1. Do the math. 3:1 looks not SO bad, but remember, there's no antenna hooked up at the other end of the line, so what's going to radiate farther than next door and their cheap stereo and $45 TV set they've been griping about? Works better when the antenna IS connected, as you would figure. The stereo and cheap TV set should be toast(!). Another story, that.

Get a good book, there are lots of them, select an antenna based on what you want it to DO, make the thing and use it, SWR and all - try to keep that under 3:1, it'll work. Get an ARRL Antenna Handbook

Just look at successful contesters. Go look at their installations. They study antennas and the propagation paths they are after. They select antennas for their needs, construct and maintain them very well,

put them up high and in the clear (old advice), ground their facilities and towers, they use good quality transmission line, enough power to produce signals at the distant ends. They don't put up junk. They tweak. They are serious. You don't have to be that serious. You can put up 2% of the antenna they do and do well, but it will take a little work.

If the duckie doesn't work, and you've even tried standing on your roof, and it STILL doesn't work well enough, get a $14.95 MFJ mag mount. Slap it on something metal upstairs. Call your friends. That may be all you need. Else, get a good book, read it, try something better, and don't fall off your roof.

73 es GL. Do it. de Lance W9EMI in Illinois.

Hello to All,

I have been licensed almost 26 years now, and I think this plan makes great sense! There are some rough points I'd like to see smoothed, but all-in-all it's a win-win situation!

There are now essentially 6 classes of license: Novice, NC Tech, Tech Plus, General, Advanced and Extra. As a VEC it's murder keeping track of whose who!

Earlier this year a board proposal was made for a three tier license program that I liked even better. League member or not, make your opinion known! And if this becomes an FCC RM, for God's sake WRITE!

Simplify, not vilify!

I'd suggest that a crystal-controlled rig would be the best choice. However frequency agility will multiply the number of contacts made many times. I would suggest a VXO rig - you should be able to get 20-40 kHz shift from a 21 MHz xtal.

There are plenty of circuits on the web - see my QRP page for links.

590. Idea for simple 18 MHz QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-22 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <35b5ac5a.0@newshost.pcug.org.au>
Source record: 81114

I've noticed that 18 MHz is often open when 21 MHz isn't. For the QRPer wanting to work DX, I can see that it could be a lot better than 14 MHz because it's less crowded.

Because of the band's narrowness, I would favour a VXO. But that means that you have to buy a crystal, many will think. But that's not necessarily so.

Many cheap walkie talkies and remote control units use 27.145 MHz xtals. Others use 28.125 MHz. These can be used on their fundamental freq of 9 MHz. I have yet to build a test oscillator, but its second harmonic should fall within the 17 metre CW band. The use of a 9 MHz VXO and freq doubler should give good service on 17m.

I am considering building a transmitter along these lines. It would only need 5 or 6 transistors all up. Has anyone tried this approach?

Thanks for all the advices, but the R/S is not an option, since I dont live in US.
There is infact not a Ham dealer in a radius of 500km from me.
And I want to get some gain, I got dipoles, and I got a crappy Yagi.
What I don't have is a SWR meter, but I intend to get one.
Now I need a omni direktional antenna, and some gain.
I got a TV dealer (he promised to get me a SWR meter a year ago, but still has not found one) , and a store that has copper tubing and stuff nearby.
I already got a mag mount antenna on my refrigerator, (to run packet) but it does not work.
I heard a lot ofthe J-pole, some negative too, but I'm going to try it anyway.
And I got a lot of crappy coax (RG8) that I could use for something else than feedline.
I've heard of some antenna using stubs of coax as radiating elements, but I havent seen a description on how to build it yet....

Again Thanks a lot! 73

Source record: 81119
Cross-posted to: rec.radio.amateur.homebrew,alt.engineering.electrical

Had a sodium vapor fixture go intermittent. Changed photo cell.
Changed bulb. Still intermittent.

No schematic. Tracing it out it looks as so: line, photo cell, tapped
inductor, lamp, return. From the tap to the lamp is a semiconductor
(plastic transistor package with base lead cut) in series with 7500 pf
mica. From the junction of the semi conductor and the 7500 pf are 95
ohms (unmarked part measuring 95 ohms) in series with 2.6k (again
unmarked part measures 2.6k, maybe varistor) to return.

As the unit is intermittent I can not trust any measurements. Now I
have
replaced the entire unit so I do not need to repair same, but as an
engineer
I am curious what the starter consists of. Anybody have a schematic
with
typical values?

This can often be a thermal effect. If the lamp starts going off and
then coming back on again after a delay, look for a thermal cut-out
somewhere in the circuitry. Of course, it may just be doing what it
is supposed to be doing, protecting you.

599. Re: ALL Hams Need to Know Abt This

Newsgroup: rec.radio.amateur.homebrew

I know a lot of you guys out there like CW, and dont like the new ARRL proposal. I am not sure I do either. I do like CW. I even like using a straight key. Heck, never owned a keyer in my life.....

But in all the arguments agains the lowering of the code requirements, I see only
a few sparse laments about the TECHNICAL REQUIREMENTS. There has been some mention of the "extra class club president that couldn't solder a PL-259"
and some mention of the failure of "modern hams" to build simple antennas such
as dipoles, but little else other than the cry that lowering CW requirements will
make the "ham bands 'just like CB'". C'mon. I know I will automatically be flamed
because I am just a tech+, but darnit, I *LIKE* CW. I use CW.

Is there just no concern of the seemingly growing number of hams, Novice, No-Code
Tech, and yes EXTRA even that have little or no technical knowledge? Maybe I just
see the rote memorization of license tests as bad because I took my test in the
"Pre-Bash" days of written tests, when I had to drive down to Atlanta and sit in an
actual FCC office to take my written test from material that I actually studied and
attempted to learn. And that, dare I say, I use daily as a radio tech who is not scared
of a soldering iron. And no, flamers, I dont *do* CB's before I get accused of being a
CB'er or something.....

Folks seem to scream about the good old days when hams were called upon by the armed
forces to provide radio operators and such, but back then, hams seemed to actually know
a bit more than just how to call an 800 number and order the latest microprocessor controlled
contest rig.

How many of us here on the list have built any homebrew projects lately?

Tech+ or not, I try to put a project together every now and again. Last thing I built was a little
hartley 40 meter 1 watt tx a month or so ago. Havent made any contact on it,

being apartment
bound and little room for an antenna, but I did sit down and build it.

How many of us can work on our own gear without sending it back to the
factory for repair?

I have a Kenwood 430S, and a service manual and a bench. The thing is simple
enough to
do most any needed repairs. Have manuals for all my rigs, havent had to send
any back
for factory depot service ever. That darned R-390A would be a pain anyway, I
mean having to
find a time machine to get it back for depot repair (insert big stupid grin
here).
I enjoy working on my own electronics if the gear needs it. Repairing the
stuff myself
means I have actually accomplished something from that theory I learned
years ago,
rather than just memorizing to take a test....

My point is, CW is a indeed a "filter" but CW or no CW, look at 75 meter
phone. Has
20WPM kept it from becoming like CB, only more rude? A lot of the "Liberty
Net" and
other escapade participants seem to be higher grade licensees. Yep some
extras in there
too I bet with the catcalls and yee-hawing. Yep, that code test sure kept
THEM out,
didnt it?

My point? My point is lowering code requirements is not gonna kill ham
radio, a hobby where
the median age is somewhere in the 60's? If the "CW or Die" folks are gonna
bust, lettem, but
if the FCC or the ARRL or whoever starts this "death of ham radio as we know
it" in motion,
maybe they can keep some order by NOT lowering the tech standards? Perhaps
even making the
written tests more difficult. I see that as a bigger filter than CW in
keeping the bands from
becoming "Another CB".

Regardless of what happens, I will still struggle along on the Novice
portions of the
bands, slogging away at the J-37 at some ridiculously slow speed, still
using CW.
Cuz it's fun. REMEMBER: HAM RADIO IS A *HOBBY* and should be fun.

But I am just a Tech+, so what do I know anyway.....?

Guess I better put on my asbestos drawers after that one......

shrug

IF AND ONLY IF your receiver is a low-voltage battery type, then just get
an old phone at a yard sale and take the wall cord plug out of it.

Hook the 2 outside leads to the speaker, and plug a phone cord into it.
plug that into your modem receptacle on your PC.

use a shareware rtty prog, (if it works for you, don't forget to register)
and listen to dentists talking about pumpkin contests, and mechaincs
arguing what is the best way to fertilize roses.

RTTY is very interesting, and varied.

CW on the air can be decoded by a program if it is not too sloppy.
There are shareware progs for that too.

Good luck

>

The first IF is 110 MHz and the second IF is 10 MHz. The other IC to
replace the MC3356 is the new Analog Devices AD8307. It looks very
promising!

There are several Mini-Circuits parts used - a couple TUF-1H DBM's, a
couple MAV-11 MMIC's, and a POS-200 VCO module.

>
>By the way, there is a continuation planned for next month. I can't
>remember what it's to cover, but the complete unit is described in

>
> Michael VE2BVW
>

According to the last paragraph, the followup article will include
methods to extend it to higher frequencies, test equipment to be used in
alignment and typical uses of the spectrum analyzer.

None of the parts appear to be too difficult to obtain and the design is
impressive. I assume the front end to be presented next month will also
be impressive.

So warm up those soldering irons!

605. Re: Homebrew Antennas !

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-23 00:00:00 UTC
From: Lance Holt <lholt@apci.net>
Message-ID: <35B7037D.CE433724@apci.net>
Source record: 80992

No Name:

Well, I guess we don't know where you are, or how much power output your transmitter has.
Since nothing seems to work and you appear to be far from everyone, you could
try mail order, perhaps, if you don't want to make an antenna from hardware
parts. An omni with gain gets big (maybe hard to ship mail order). J-Poles are
not THAT good. They are simple, easy to make with coax, twin lead, or copper
plumbing pipe. Not much gain. Mine works to a distance of 40 miles, but not
complete coverage in that radius. Bought it because it was cheap and light,
easy to mount, not because it was a good antenna. A Yagi is much better, but
not omni, of course.

Can you order mail order from where you are? From Europe or US? A cheap MFJ
VHF SWR/wattmeter should help you check out antennas you can make. We're
talking $30USD plus shipping, maybe VAT, up to maybe $50USD and you have one.

Again. Get some metal up in the air. Sounds like it doesn't make much
difference what you use to start with. Just get something up high and see what
happens. Antennas aren't magic, almost anything will work a little bit. You
have to start with something.

GL again. Do mail order if you can. Make simple antennas and elevate them.

The AD8307 is a recently released log. amp with about -78dBm noise floor.
Input range is -72 to +16 dBm (@ Z=50 ohm).I must get a copy of the article myself.You should find datasheet (20 pages) in .pdf format on Analog Devices Website (http://www.analog.com).
(I work for Analog in UK but wasn't aware of the article).

607. Help with finding type of meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-23 00:00:00 UTC
From: J Samuel <jaysam@deletethis.deletethis.caa>
Message-ID: <35B74F25.71AB@deletethis.deletethis.caa>
Source record: 80994

Hi,
First of all thanks for all the replies I get from this newsgroup.
I am trying to salvage some meters off of surplus rf equipment. As
far as I can tell the equipment is some sort of a valve control/flow
control device. But it surely has RF coming in and going out (thru BNC
connectors). There are two meters in the front panel, which have 0 - 10
marked on them. These marking seem to be specific to the application and
not Volts or Amps. I am trying to find the following information:

1. If I have a meter, how do I find out if it is a volt meter or
ammeter?
2. If ammeter (that is what I am looking for) how do I find its rating
(eg. 1-100mA, 0-1A, etc.).

I have come across such problems many years ago but I have completely
forgotten how to solve. Would appreciate if someone could help me on
this.
Please post replies to this newsgroup.

Jay Samuel

PS: If this meter turns out to be an ammeter I am trying to build an
inexpensive SWR meter for my QRP TX.

While I agree with your IC soldering technique, I must point out that
using steel wool to clean a PC board is a real NO NO, unless you
are willing to carefully inspect the traces several times for almost
invisible pieces of wire. I sheepishly admit that I found this out the
hard way on several different homebrew projects that didn't work
properly. At times the steel wool's effects didn't show up using an
ohmmeter to measure the suspect traces. I've taken to using
TarnX to clean the traces, then rinsing carefully if I want bright copper.

From: Roy Lewallen <w7el@teleport.com>
Message-ID: <35B7756C.398A3E0@teleport.com>
Source record: 80999

Some years ago I measured the effect of various coatings on the Q of an inductor wound on a powdered-iron toroid core. There were very few materials that didn't lower the Q quite substantially. Q-dope made by dissolving polysytrene in acetone was about as good as any, although even it also reduced the Q a bit. For a lot of applications, Q isn't very important. But if the inductor is used in a narrow bandwidth tuned filter or in an oscillator tank circuit, Q can be very important, and you should be careful what you coat the inductor with.

Almost all analog meters are ammeters. You put a resistor in series with
or as part of the winding resistance to get voltmeters.
There are techniques using parallel resistors, but with today's high impedance
digital voltmeters it's easier to:
Connect a big resistor in series with the meter. Hook up a voltage source
and set for a full-scale reading. Measure the voltage across the meter and the
resistor.
A little math and ohms law will tell you the internal resistance and full-scale
current.
RF ammeters are a little tougher, but if the above technique doesn't work, it won't

make a good QPR SWR meter anyway.
If you want cheap, go to a garage sale and pick up a photographic light meter.
Very sensitive meter.

> > --

I haven't seen the article yet, but it sounds very interesting. Why monkey around with obsolete and expensive crystal filters, though? Why not feed the baseband video output into a $50 16-bit sound card and use DSP-style filtering on a PC to achieve any resolution bandwidth desired, up to 16-18 kHz or so? You could probably achieve at least 80 dB of dynamic range before hitting the sound card's noise floor, which is as good as a $4K-$5K Tektronix 49x-series analyzer. The higher bandwidths could be handled via ceramic or LC filters.

You might even be able to modify the sound card (by taking the output signal right out of the DAC, before any DC blocking caps) to provide the VCO's sweep drive, with near-16-bit precision all the way down to DC. Implementing an "auto-setup" feature, where the sweep speed is automatically chosen based on the span width and resolution bandwidtth, would then be trivial. (It's not much fun to use a spectrum analyzer without this feature, believe me, especially if you don't have some form of display storage.)

How is Hayward stabilizing the VCO for narrow sweeps? What is he using for video output?

620. SSB QRP kit...Small Wonder Labs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-23 00:00:00 UTC
From: hduff@ica.net
Message-ID: <35b7412d.0@lightning.ica.net>
Source record: 81007

Not so often, I come across something that stands out in value and performance and feel that it's worthy of a plug. I just wanted to take an opportunity to share the satisfaction of my dealings with Small Wonder Labs, run by Dave Benson, NN1G.

I bought a partial kit of the White Mountain-20, a SSB QRP transceiver. I had very little trouble assembling and aligning the project to get it on the air. The manual is extermely well written with the Heathkit style divide-and-conquer construction where you build and test by functional block before proceeding to the next stage. The WM offers an exceptional receiver using passive diode ring mixers and a crystal filter. A variable VFO provides a span of at least 150 kHz, The transmitter yields 3 watts of clean SSB. I've made many contacts using my WM-20 into a 1/2 size G5RV from my home near Toronto. This past weekend I got into Turks and Caicos, last night I got into Europe...pretty good for 3 watts and a modest antenna.

Dave offers full board level kits of his transceivers. He is also very flexible. I'm in the unique situation of having a very comprehensive 'junkbox'. I saved a few bucks by purchasing a partial kit. Dave was very accomodating to this and didn't 'gouge' me by trying to pad the loss of a complete kit sale by inflating the price of what I wanted. Notwithstanding, unless your 'junkbox' is well stocked or you have time and energy to burn by sourcing the parts elsewhere, I recommend getting the full board level kit. It really is a deal.

Any questions or queries that I had were always answered promptly by Dave via e-mail. His technical support is outstanding...He more or less guarantees to help you get your radio up and running by phone, email or otherwise and offers to troubleshoot/ align it for a nominal fee if you still can't get it going.

I just ordered another White Mountain kit for 40 meters which I will build for CW use (it's really designed as an SSB rig). Although the SW and GM series are CW radios, I am partial to the superior receiver design of the WM.

If you have any interest in building and/or QRP, I urge you to have a look at his web site. http://www.fix.net/~jparker/sml.html or E-mail Dave at: bensondj@aol.com
You'll find details on the 'SW' and 'GM' CW QRP series as well as the 'WM' SSB QRP rigs.

It's refreshing these days to get top notch personal attention before,
during and after a purchase. Small Wonder Labs hooked me with
a great product and excellent support.

This blurb is completly unsolicited. I have no affiliation with
Small Wonder Labs other than being a very satisfied customer.
I simply hope that the availablility and attractive price of such kits
encourages and stimulates more homebrewing.

There are transverter kits available, plus some 900MHz commercial gear can be modified (new filters avail. from Murata) and reprogrammed for the ham band. I've never done either of these, as my 900MHz ham activity is all ATV. Also, be aware that the band is full of part 15 devices, etc. and is pretty noisy in many metro areas, plus there's a lot of interference from cell sites in the 800 MHz band, at least with some equipment.

Date: 1998-07-24 00:00:00 UTC
From: Jim <jsides@flash.net>
Message-ID: <35B8D00A.4EB3@flash.net>
Source record: 80922
Cross-posted to: rec.radio.amateur.homebrew,rec.radio,rec.radio.amateur,rec.radio.amateur.equipment

Hi Don,

I recently picked up a new book titled:

"Build Your Own Intelligent Amateur Radio Transceiver"
by Randy L. Henderson

Publisher: McGraw-Hill
Other : 355 pages, Hardcover
ISBN # : 0-07-028263-3

The book covers such topics as:
1) Understanding and building a microprocess-based receiver
and/or transmitter
based upon the cheap but versatile 80C31 microcontroller chip
from Intel
2) Interfacing techniques for the various input/outputs of the
IC's used
3) Understanding the "real-world" behavior of RF circuits as well
as
4) Techniques for keeping digital switching noise out of
sensitive analog circuits
5) Understanding frequency synthesis techniques used in modern
radio equipment
6) Understanding AM, SSB, CW, VFO, BFO, IF, XTAL filter circuits
and a whole lot
more HF circuitry, therory and applications that you will be
working with
6) Printed circuit board fabrication techniques you can do at
home, cases, ect.

This book seems to be a great cookbook-style guide that completly
covers the
building of a rather sophisticated radio transceiver (or receiver only)
while
giving you the understanding to do some re-design on your own. You can
modify the
radio to strip out or add ALL of the bells and whistles you might think
of, for a
one-of-a kind completely customized rig that you build yourself !!

I am still reading (learning a LOT !!) and collecting parts. My
budget for this
radio is around $100-$200. Once you start buying some parts, the
incentive for

actually building the rig goes up tremendously. If nothing else, this book got me
back to building my own stuff. EXPERIMENTING with CIRCUITS is 90% of the fun for me!

I think the book sells for about $39.95 U.S. (or more?) and is a hardcover book.
I got the book FREE through a book club. If you can't find it (for free), Email me
and I can get THAT book AND up to 4 other great electronic books (of YOUR choice)
with a TOTAL VALUE not to exceed $135.00, for just $4.95 + S&H, all sent to your door
along with a billing statement from McGraw-Hill. The only catch is that you MUST buy
at least 2 MORE books (at very reasonable bookclub discounted prices) over the next
twelve months. Also, "I get two free books of my choice" for refering you to the
bookclub. We all win on the deal !!!! This offer was made by my bookclub on my last
mailing and is good for at least another 2-3 weeks. Anyone interested, PLEASE
LET ME KNOW and I will email you a list of books to choose from. You pick from the
list and I will place the order. You should get the books in 1-2 weeks from order.

Good Luck, and 73 de N5APG - Jim

P.S. For build-it-yourselfers, I would also recommend the following book(s):

"Mastering Radio Frequency Circuits - Through Projects & Experiments"
"Secrets of RF Circuit Design - Second Edition"
"Old Time Radios - Restoration and Repair"
"Mastering Oscillator Circuits - Through Projects & Experiments"
"IC Op-Amp Cookbook"
"Making Printed Circuit Boards" - For the Hobbyist

and WITHOUT a DOUBT, don't be caught without the book:

"The ARRL Handbook" !!!!!!!!!!!!!

Before working too far in this direction, you should know that pc programs that "decode" cw have a very poor record for producing any usable output at all, let alone being accurate. Most cw in the ham bands is hand sent and is subject to frequent and widely varying spacing errors. These just about destroy any effort at converting audio dits and dahs into text on a screen. Such programs work much better with machine-sent code, but the ever-present qrm, qrn, etc. introduce very frequent errors as you might expect.

>> -art clemons-
>

Not only that, but many brands of steel wool are impregnated with oil to keep them from rusting. That oil can also get on the circuit board.

My favorite is just a dash of regular household cleanser and a wet paper towel. Rub over the board for a minute until the copper is bright, and then wash it well and dry it and it should be great for soldering.

I've also found that when I make pc boards with the photoresist method, leaving the photoresist on will keep the boards protected from corrosive materials they come in contact with. It can usually be soldered through OK if the layer applied wasn't too thick.

In the hot, humid weather we've had here lately, several of my uncoated boards have sprouted green patches on some of the copper traces. Probably some of the dust particles in the air are corrosive (and we breathe that stuff!)

Dear James,

While it is true that the change in the license program would assimilate Novices and Tech Pluses into what would essentially be "General" class, you will neither lose spectrum availability, nor will you lose credit for your previous achievements.

The reduction of what is now essentially 6 classes of license to four has been long overdue. If I had my druthers, there would be three, but I personally will settle for four.

If this does nothing more than remove the "Technician" vs "No-code Technician" stigma, I am all for it. Despite being an Extra myself, I have yet to meet anyone who was in that NC category (except for some of the people who went thru the 2 day classes run by a certain West Coast personallity) to be as every bit as competent and anxious to be a part of Amateur Radio as the other classes.

I for one hope this gets through the RM process in a hurry and it is adopted as soon as law allows.

TarnX contains acid, which will contaminate the copper, and
would need to be rinsed, no scrubbed off VERY thoroughly.
I don't recommend it. Try fine emery cloth, which is neither
conductive nor corrosive.

> then wash it well and dry it and it should be great for soldering.

I do that before applying the photoresist. After etching I use acetone
to get rid of the photoresist. I recommend, however to keep that coating
for drilling (You see the holes much better) and remove it just before
soldering (protection against staining)
> I've also found that when I make pc boards with the photoresist method,
> leaving the photoresist on will keep the boards protected from corrosive
> materials they come in contact with. It can usually be soldered through
> OK if the layer applied wasn't too thick.
I do not recommend that. You are never shure, if the connection is
soldered correctly, if You have too much "dirt" in it. This is
especially bad for low level analog signals.

> In the hot, humid weather we've had here lately, several of my uncoated
> boards have sprouted green patches on some of the copper traces. Probably
> some of the dust particles in the air are corrosive (and we breathe that
> stuff!)
My first PCB (a 68HC11 board) had no coating. It shines perfectly red
after four years... Since then I have *always* applied a (solderable)
protective laquer just after removing the photoresist. If I know, that
the board is used in corrosive (humid, smog, whatever) conditions, I
clean the board again with acetone after soldering and apply a plastic
laquer twice. This completely seals the solder side of the PCB.

The other poster describes the process. I have been picking up
surplus meters from American Science & Surplus (I'm not connected
with them). The meters show fuel-level, but actually are 0-5Vdc
full-scale meters. Just jumper around the series 5.00Kohm resistor
and you have a 0-1MA meter. Then re-mark the scale. The URL to their
site with a drawing of this meter:
http://www.sciplus.com/cgi-bin/basket/901280515.58/fix/25851.html

Try this URL :-

http://www.analog.com/product/Product_Center.html

Then key in "AD8307" (without the quote marks)in the search box
(& hit its button).
That should take you to a brief description + there's
a hyperlink to the datasheet (which you can download).

I assume your problem was not knowing how to drive our website -which
certainly could be improved.

I am on the first floor of my house but have no close devices to use as a ground (nearest water pipe is @40' away). Short of pulling back the carpet, drilling a hole in the slab and driving a ground rod in, does anyone have any ideas? The room is fairly small so putting some type of grounding wires or sheet metal is probably out of the question.
I'm running mostly older tube type gear on CW and AM. Any ideas are certainly appreciated.

Richard:

At first, I was going to suggest that the lamp was nearing the end of its life. Since you have replaced the bulb and the photocell, I would check to see if there are any other loads on the same circuit as the lamp fixture. HID lamps (HP sodium in particular) are very sensitive to line voltage drops. If another load, such as a motor that draws a large current at start up, causes the voltage in that circuit to sag, the lamp may go out and not restart until it cools a bit. As for the photocell, is there any extraneous light that could be triggering it? I know this is pretty obvious, but remember, the flash of light would only have to be momentary (headlight from a car, lightning etc) and the photocell would open and the light would go out, and not restart for several minutes. I dont have any schematics of HPS lamp starters, but I do know that they simply supply a high voltage pulse to start the lamp, then they could be removed from the circuit if you wanted to. Its doubtful there is a problem with the ballast (a simple reactor, or a CW auto transformer if high power factor), they would most likely burn out and open if they failed, not an intermittant problem. You can check for a thermal cut out, especially if it is an indoor fixture, its doubtful an outdoor fixture would have one. Hope this helps.

Source record: 80930

I'm interested in building an auxillary speaker for my shack. I'd like to build it into a larger cabinet, use an amp to boost audio, perhaps some kind of tone control, an on/off switch etc. Does anyone have or know of plans to build such an accessory? If I could find the right kind of plans for the electronic side of it I think could make something that sounds great and looks beautiful.

Thanks in advance for your help,

Scott

Absolutely not! Outside its passband, a bandpass filter looks like an open circuit
(high impedance anyway). So each filter should be designed to be 50 ohms inside
its individual passband. Energy on those frequencies will only see the correct filter.
The other filter is essentially invisible.

Which $50 sound card samples at 600 kHz? That's the minimum sample rate
you'd need if you only used the 300 kHz 10 MHz IF LC filter instead of switching
to the 30 kHz crystal filter when you want higher resolution. Most sound cards
top out at a sample rate of 44 kHz. That's not even enough to work with the crystal
filter. And what processor clock rate do you need to get enough T cycles between
samples to implement a useful FIR filter?

Also remember that the video detector depends on the IF filter bandwidth to
give it single signal capability. If you don't go to the narrower filter when you
want higher resolution, you'll have a nasty image response problem (IE the
video detector is double sideband, to get single signal, you have to have a
narrow enough filter in front of the video detector to eliminate one of the
sidebands).

To get around that with DSP, you need an I/Q demodulator design, IE a pair of
DBMs fed in quadrature with a 10 MHz LO, and feeding the left and right channels
of the sound card where you'll apply a Hilbert transform to one of the channels, filter,
and sum to get single signal. This is actually possible if you'll limit bandwidth to about
3 kHz or less, but remember that the maximum sweep rate is proportional to filter
bandwidth, so using such a narrow filter limits you to very slow sweeps. That's a
problem if you're using the spectrum analyzer to aid in tuning a filter network, and it
is a problem if you use a normal persistence phosphor CRT for the display (IE it flickers
badly). Using the PC for storage and display solves the latter problem, but not the former.

>You might even be able to modify the sound card (by taking the output
>signal right out of the DAC, before any DC blocking caps) to provide the
>VCO's sweep drive, with near-16-bit precision all the way down to DC.

>would then be trivial. (It's not much fun to use a spectrum analyzer
>without this feature, believe me, especially if you don't have some form
>of display storage.)

Now that's a more practical idea.

>How is Hayward stabilizing the VCO for narrow sweeps? What is he using
>for video output?

He's using an opamp ramp generator and an oscilloscope with XY capability as the display. Since the same ramp is used to sweep the VCO and the X channel of the display, you get automatic tracking. You need to use a marker comb for display timebase calibration.

Source record: 80933

On Thu, 23 Jul 1998 08:45:24 -0700, larryc@northwest.com wrote:
>Would appreciate discussing the differences/advantages of PM over FM.

Phase modulation is applied to a stage following the local oscillator via a circuit called a reactance modulator. FM is done directly to the local oscillator, most commonly with a varactor across the frequency determining circuit element. The advantage of the latter is that it works all the way down to DC. In other words, you can get FSK by applying a DC mark or space. PM won't allow you to maintain a carrier shift. It only applies AC modulation. It also inherently supplies a pre-emphasis to the modulation of 6 db per octave. FM can be "flat", or you can use a pre-emphasis network in the audio stage preceding the modulator to get whatever pre-emphasis slope you may want.

You also can't achieve much frequency swing (deviation) with PM, and must use multiplier stages following the modulator in order to get sufficient deviation. With FM, you can get virtually any deviation the VCO design will allow, so you can do it directly on channel and don't need multiplier stages. That's the way most synthesized radios work.

So the advantage is all on the side of direct FM rather than PM. PM was used in the early days before varactors when it was hard to achieve linear direct FM of the LO. About the only time you might want to use it now would be if the LO were external to the radio and couldn't be directly FMed. That might be the case if the LO were a high precision standard.

> Terry (KA5IHV)

Why do you want a ground, Terry?

If you need an electrical safety ground, the third wire of the AC receptacle
will supply that. If you are using a balanced antenna, you don't need a RF
ground at all. And if you are using an unbalanced antenna, it needs a ground
at its feedpoint, not back at the rig.

Unless your rig *is* the feedpoint, IE a longwire, you don't need an RF ground
at the rig. If you are directly feeding an antenna from the back of the rig, you need
a better RF ground than a single ground rod can provide. If there is rebar in your floor,
and it is all bonded together, you can connect to that. That's called a Ufer ground,
and is a good RF ground because of its large capacitance to Earth.

If, like many of us, you're using a balanced antenna, IE dipole, you don't need
an RF ground at the rig at all. Adding one is a waste of time and effort. If you
have RF in the shack, solve that problem by using a balun at the antenna feedpoint,
don't bandaid it by trying to supply a RF ground to the rig. That doesn't solve the
problem of common mode currents on the feeder. Your antenna pattern will still
be spoiled even though the mic might not bite you anymore.

Now lightning protective grounding is a separate issue. But that needs to be
done *outside* the house. You don't want to invite megavolts and kiloamps
inside your house in order to find a way to Earth.

647. Question about a old radio

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-25 00:00:00 UTC
From: Randy Lee Hopkins <rlhopkins@huntington.in.us>
Message-ID: <35BA23D1.34ADE3E2@huntington.in.us>
Source record: 80935

I was wonder if anyone can help me w/ a radio I recently purchased. I found a old Readers Digest Mutli Band Radio for $15.00 it had no owner manual and I don't know who to write to see if I can require on. But, I figure one of you guys might now a little about this radio.
My Questions:
1. The radio has a 1/8th phono jack for a external ant. Is there a certain way a ant needs to be wired to be used on the set? I have already replaced the 2 telescoping ant. , but before I replaced them I wrapped a old CB ant around the remain ant. and I could pick up converstions on the CB band. Now I can't and I would like to be able to again and also I need the external ant to give me a better chance at picking so SW stations and TV.
2. The last one here. The radio has a switch for AFC. What is AFC and what does it do? That is a function I have not heard yet.
I would appericated any help someone could give me. You can e-mail me at this address or at my actually address: "jason_hoss_allen@hotmail.com". PLus here cause I'll check in when I can use my uncles computer.

I have an Eimac 8560AS tube, with matching socket and cap that I would like to sell. Condition of the tube is unknown but is believed to be working. Taken from a Motorola business-band amplifier (TLD6392A-2) which I think was working when removed from service. No obvious signs of distress.

I would like $50 plus shipping ($3 USPS Priority mail). If the tube doesn't work, send it back and I'll refund your money.

I also have a very large heat sink that was used with this tube - measures approx. 6" square with 3" deep fins. There is a ceramic block that insulated between the Eimac tube and the heatsink. $10 plus shipping (about $5 UPS) for this item.

Contact me via e-mail for more information.

Hi brad,
Try Surplus Sales of Nebraska, Orders 1-800-244-4567 Fax 1-402-346-2939
Email grinnell@surplussales.com
Catalog #8 PG. 76,
2.5 - 15pf 1250v, 1/4" shaft $8.00ea # (CAV)160-107-18 bushing mount
shaft length ?
the catalog says 1/4" but It looks longer. -call and ask- this looks like
the best deal.
4.0 - 28pf 750v, 1/4" shaft $12.00ea # (CAV) A2142547 2 hole mount
shaft length 5/8"

2.8 - 16pf 1500v, 1/4" shaft $23.00ea #(CAV) HFA-15B bushing mount
shaft length 9/16"

3.0 - 25pf 1400v, 3/16" shaft $25.00ea #(CAV)G603470-2 bushing mount
shaft length 3/16"

They have many more going up in capacitance.
If you want to buy site unseen (if you don't want to wait for the catalog)
these all look fine to
me. Just pick the shaft diameter and length and mounting style.
OH I did all this and just noticed you wanted a vernier! Well they also
have verniers.

BTW I have several 6 to 1 verniers. They are similar in style to the Velvet
Vernier on
PG. 320 of Surpluses catalog. If you are familiar with Duo-Dial 10 turn
counter they
are shaped similarly
My verniers do not have numbers on them.
I'll sell them for $17.00 vs. $49.00 for the Velvet Vernier.

Hope this helps
Mike

650. CB-Crystal 18 MHz CW Rig Now Working!

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-25 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <35ba48e5.0@newshost.pcug.org.au>
Source record: 80938

The rig described above has now been built. It uses 2N2222 for the VXO, buffer, 9 MHz amp, 2xBFY50/2N3053 for the doubler (as per Solid State Design), 2N3553 as PA and a PNP for the keying. Power out is 1w. Sorry no circuits are available at this stage.

Only contact so far has been to ZL.

So the idea is certainly practical, and probably the cheapest way to get a signal on 17m.

73,

Peter Parker VK1PK parkerp@pcug.org.au

I actually applaud the ARRL. Finally they showed some backbone and made the
first real cahnge in amatuer radio in over 30 years. Let's face it, after
teh present generation of old fuddy duddies die off the amatuer population
will decrease steadily over the next 5 to 10 years. The ineternet is going
to replace it to some extent. Then valuable spectrum will no longer be able
to be held on to. Thus your little world will slow degenerate arround you.

Oh yeh and one other thing. use a little brain power and maybe you can
upgrade to extra or class A. If you are a general class now, all you have to
do is study a little theory and bingo you have a class A license. Then you
can get away from the class C subbands. Most second year egineering students
can easily pass the written portion.

#I was wonder if anyone can help me w/ a radio I recently purchased. I
#found a old Readers Digest Mutli Band Radio for $15.00 it had no owner
#manual and I don't know who to write to see if I can require on. But, I
#figure one of you guys might now a little about this radio.
My Questions:
1. The radio has a 1/8th phono jack for a external ant. Is there a
certain way a ant needs to be wired to be used on the set? I have
already replaced the 2 telescoping ant. , but before I replaced them I
wrapped a old CB ant around the remain ant. and I could pick up
converstions on the CB band. Now I can't and I would like to be able to
again and also I need the external ant to give me a better chance at
picking so SW stations and TV.
wire it tip to antenna,ring to ground.

2. The last one here. The radio has a switch for AFC. What is AFC and
what does it do? That is a function I have not heard yet.
#I would appericated any help someone could give me. You can e-mail me at
#this address or at my actually address: "jason_hoss_allen@hotmail.com".
#PLus here cause I'll check in when I can use my uncles computer.

****

No the internet is kicking stronger than any radio licensed service. AOL has 10 times more users of the internet than the amatuer population. The internet and the money spent to buy a computer can be put to more usage than the $2000 price for most new rigs. By the way can be used for only one thing. At the present growth of the internet and without changes to the amatuer radio service, the population will dwindel over the next ten years to the lowest levels in over fifty years. When that happens, try getting legislation to keep the bands when they come under attack from other services and auction. At 600,000 licensed hams in the US. that is a real small minority. Believe me we have as much clout as an fly on an elephant. If the numbers drop any further then we have less than a fly.

see you really don't understand what keeps the CBer's from becoming Hams. It is the 5 WPM code. That has not totally been abolished. 80% of the so called CB operattors that you fully dislike don't want to and will never want to learn code. So these changes will not bring on the doom and gloom that so many of the fuddy duddies are claimimg. It further builds the senario to the CB world that many Hams are arrogant, conceited, and very out right borish. To the CB world the amatuer service is a group of old farts that are waiting to die and have nothing better to do than complain. Instead of trying to educate them they see only from the amatuer community a condescending attitude that is quite offensive at times. To the uneducated population that has nothing to do with any radio service we are lumped into one catagory with them when it comes to TVI and other interference problems. To the publiic,it is all the same.

****
??>I read the proposal and it sounds perfectly acceptable to me (as an

??>you should think about what the proposal really means and what impact
??>it's really going to have, which isn't that much. If the hobby is to
??>survive into the next century, it certainly requires this sort of change.
??
??Your reasoning gets fuzzy again here. Why would you assume that I
??didn't think about it? Is it because you normally shoot off your mouth
??without thinking and you just assume that everyone else does too, or is
??it because you think that anyone that doesn't agree with you completely
??is either just plain wrong or misunderstood the situation? Wake up!
??You are not the only one entitled to an opinion.
??
??As it happens, I have given a great deal of thought to it. I am in favor
??of expanding the HF privileges of Tech+ type people who have displayed
??the skills needed for responsible HF operation, but aside from that the
??present licensing system works very well, and only needs to be simplified

??a little, not radically changed. I believe the proposal does too little
to
??sustain the privileges of existing licensees who have earned their place
??and gives too much away to an unknown quantity of potential newcomers
??of uncertain quality. In other words, I think it's a foolish risk.
??

****

I disagree. I really think the ARRL did not do enough. The license classes should have been reduced from fice to three, not five to four. There should only be a 5 and 10 WPM code. The 10 WPM minute code speed would only allow for more usage of CW spectrum and not be used to limit phone privileges. All entering hams must show a proficieny of at least 5 WPM. Voice priviledges, other than entry into the amatuer band, should not restrict phone priviledges. This is funny, old time hams think is great to restrict priviledges to modes of transmission because they do not demonstrate proficeincy in CW. Yet there is no demonstration test to prove proficiency in other aspect of the amatuer radio service. I guess it means you demonstrate proficeincy in the reception of CW, you can do Slow Scan TV and other aspects of the hobbby. Interesting thought.

**********8

??It's obviously going to have a huge effect on the future of amateur radio,
??because it represents a significant lowering of standards. And where did
??you get the idea that amateur radio was in any danger? We've just taken
??on a huge crop of new licensees, and we're considering expanding their
??HF privileges, which will probably attract more. Amateur radio is in the
??best shape that I have ever seen, and I'm not ready to sell out, so take
??your doom and gloom panic-mongering somewhere else.

****

I think there will be a spike, but only a small one. I think the amatuer population will only grow by about 10 to 20% after the initial passage. Then will dwendel down to a net growth over the next 5 years to about 5%. I still believe that after 10 years the amatuer radio service will start a long and steady decline in population in the next century unless more steps are taken to bring in more members.

Tom:

Having lurked arround some of the amatuer Usenet groups, I have seen some posts from 1x2 calls that I wonder how they passed the tests? Yes I am in favor of good technical skills. This service was started by engineers. I do not suggests that all be engineers, but a working knowledge of the hooby and electronics would be nice. I have yet to see the logic in restricting priviledges based on demonstrated proficeincies in one aspect of amatuer radio and not in others. CW is a part of amatuer radio, it is not the whole of amatuer radio. It is about time teh attitude of, "well I had to, so you have to" die. I do not favor the complete abondonment of CW just a minimum proficeincy. That is what the written tests do now for higher licenses. I just don't think that CW should be tied to advancement oin the usage of phone and digital priviledges.

Besides the 5 WPM does well to keep a vast majority of the CB operators out of the amatuer bands. If they refuse toi learn code let them stay on their sliver of frequency and be happy.

Right, that's not what I meant. You'd go ahead and use the crystal or
LC filters for wide bandwidths, feeding the demodulated video output
(basically the Y-axis drive) to the sound card's ADC as a varying DC
signal. But for narrow bandwidths (say < 15 kHz) you'd feed the actual
baseband signal through the next-widest-available crystal filter for
antialiasing, and then through to the ADC.

One concern I didn't think about when I wrote that, though, would be IMD
in the cheese-whiz $50 sound card's ADC. I was thinking the noise floor
would limit the dynamic range, but the spurious responses due to IMD
might be even worse. Still, even if you can get 60 or 70 dB of
spur-and-noise-free dynamic range, you've got a useful instrument.

From what you're saying below, though, it sounds like this design has no
provision for LO stabilization, so narrower spans and resolution
bandwidths might not be a useful thing to have.

> And what processor clock rate do you need to get enough T cycles between
> samples to implement a useful FIR filter?

That's not even remotely challenging anymore, with 400+ MIPS Pentiums
going for next to nothing. The new AMD K6-3D chips would be a great fit
-- they're cheaper than similar Intel chips, and their high-throughput
SIMD floating-point capability could deliver substantially better
performance in this application. Do not underestimate the DSP power
available on a cheap consumer PC these days.

Also, you wouldn't want to use discrete FIR filters. Put in perspective
(no pun intended), any CPU that can run Quake is not going to have much

trouble running a real-time FFT. :-)

former.
>

Right, but keep in mind that as long as you're using a discrete filter,
its implementation (software or hardware) has nothing to do with the
fact that you can't run a fast sweep through a narrow bandpass. Anyone
who's ever fussed around with the var persist mode on a 141T can see the
advantages to moving as much of this functionality as possible into the
digital domain. Again, a real-time FFT analysis on the baseband signal
will yield a lot more information than sweeping a signal through a
discrete filter, and in a lot less time.

Using the stereo ADC for I/Q demodulation sounds smart. Again, I don't
think the limit with available CPU power would be anywhere near as low
as 3 kHz.

> He's using an opamp ramp generator and an oscilloscope with XY capability
> as the display.

Hmm, that's not particularly desirable unless you have a storage scope. Of course, analog jobs can be had for $200 these days. I would've thought he would have some sort of PC interface, perhaps with a DAC/ADC pair on the printer port. For spectrum analysis, an oscilloscope is overkill in some respects (bw and sweep speed), and inadequate in others (lack of storage and/or var persist on most models hobbyists are likely to own).

> Since the same ramp is used to sweep the VCO and the X
> channel of the display, you get automatic tracking.

Dunno if "automatic tracking" is the right term -- every commercial SA I've ever seen tunes the LO with the horiz sweep signal. "Tracking," to me, suggests that you have a tracking generator (which ought to be fairly easy to add to the design you're talking about).

> You need to use a marker
> comb for display timebase calibration.

Why doesn't he just take the ramp output from the scope timebase? And how does he linearize the VCO? (That's another thing that's awkward in hardware and trivial in software.) Guess I need to hunt down that issue and see what the various rationales were...

Hi Chris,

the AD8307 is a very fine part.

I used it for an inexpensive (costs below 25 $) but precise (error < 1 dB)
level meter for frequencies from 100 kHz
to at least 110 MHz and levels from 30 to 115 dBuV.

Hello Folks,

I have a bunch of microwave items forsale. Trying to sell to help with the cost of a HP 141t and plugins spectrum analyzer.

So here goes

HP wavemeter X 532B Covers 8.2 Ghz to 12.4 Ghz Perfect Condition
$75.00

WR 75 waveguide terminations stepped and concical. The termination cane unscrewed leaving a closed piece of waveguide suitable for making you own SMA to WR 75 transition
$10.00

Microwave Associates WR75 waveguide circulators
$10.00

Phase Modulators These are 3 pieces of WR 75 waveguide about 4" long that all have a common flange.
About 1" back from the flange is a varactor diode that penatrates the center of each waveguide.
I do not know what cap/volt of the varactor. The end of each waveguide is terminated with a tunable plunger.
The common flange can easily be cut to seperate the pieces of waveguide.
$10.00

Omega Slotted Waveguide section Model # 723X12 WR229
Omega "N" to WR229 Adapter Model #103X12
Omega "N" to WR159 Adapter Model # 105P All excellent condition
Make offer

More MW components

Waveguide Section

2) sections of WR159 Small 8 hole flange 15-1/4" long $15.00 ea

1) section of WR159 Large 8 hole flange 12" long $10.00

1) section of WR159 Large 8 hole flange 8-3/8" long $10.00

1) section of WR159 Large 8 hole flange 6" long
$8.00

2) sections of WR90 8 hole flange on 1 end
$15.00

1) directional coupler WR187 -40 db down from
5400 Mhz to 5900 Mhz Round flange 8 holes
$15.00

Western Electric Power detector Waveguide section
of WR159 Small flange with BNC connector for
power reading
$10.00

Western electric Directional Coupler -20 db for
Wr159 small flange with 260A switch
$20.00

2) Downconverter with WR75 input and SMA LO input
These downconverters have a 70 Mhz amp built in and
were design for 10.7 Ghz to 11.7 Ghz Amp can be
removed and mixer IF will operate to at least as
low as 20 mhz.
$30.00

All plus shipping

Thank you

PaulC@snet.net

Hello Al

I have used them (XF9-NB and the narrower 300Hz XF9-P) and they are
still an excellent spec even by some of the more modern varieties. BTW I
use Network Science CW filters in the Drake TR-7 and that can certainly
winkle Em out!

I am looking for a basket case HF amplifier that uses a pair of
3-500Z, 3-1000Z, 8877, or other tube(s). Will consider almost any-
thing, but would prefer Drake, Swan, Henry, Heath, and or????.
The condition can be anything from bad tubes to melt down, as long
as the case and the transformer are good. Anyone have something that
might be of interest.

Thanks
Art

I've got several IC-0xAT rigs and accessories. Reciently I got a HTX-202. I tried using the headset on the 202 and it won't transmit when I toggle the switch on the PTT interface for the headset. The headset works just fine on the Icom gear. I can transmit from the 202 when I press the radio's PTT.

What can be done to get the headset to work with the 202 and still work fine with the Icom stuff?

==========

1) IMO the ham fraternity should welcome CBers ,who are prepared to
do basic study and sit the tests. CBers should not be considered
'inferior' lock stock & barrel.

2) With morse testing highly likely no longer required after the
WARC 2002 , it possibly being replaced by a slightly 'heavier'
multiple choice questions technical/operational skills test ,Ham
radio will still remain a stimulating hobby for many.

There is no harm done when as Ham Community we become somewhat more
tolerant towards others active in the field of hobby radio
communications and stimulate them to embrace what we know as Amateur Radio .

Actually, amateur radio started out mainly among teenage boys and a few
older lay adults who were excited about this new thing called radio and
wanted to learn all that they could about how it worked and what they could
do with it. They weren't engineers, but they very much wanted to acquire
engineering skills to further their activities.

Unfortunately today it has degenerated to a group of mostly old white men
interested mainly in using radios rather than in understanding them. They
can be differentiated from CBers only in that they can manually emulate a
modem. They exalt in their antique skills while disparaging more modern
ones. They see the exams, particularly the all important Morse speed tests,
as gatekeepers to their exalted ancient society.

A relative few still carry that spark which drove early amateurs to learn
everything possible about radio, but too few do. Most are content to play
radio games with their shiny Japanese transceivers, or to gossip and
grouse incessantly about their latest illness, or about how amateur radio
has gone to hell. They never realize that they are the main reason that it
has gone to hell (to the extent that it has).

Their numbers are augmented by those, again generally over 30, who see
amateur radio as a cheap cellphone substitute (which it isn't) and as a
personal communications service somewhat less crowded than CB,
which they've done their best to turn it into. They can generally be identified
by the fact that their only radio is a HT, which they've never opened to see
how it works, or by the fact that they went out and bought a commercially
made *dipole* or magic aluminum vertical for their new Japanese HF
transceiver (which they don't dare open either).

Though technically as inept as the average CBer, many of these people
have rote conditioned themselves to emulate a modem, and see that as
a gatekeeper to keep out their former associates. (One infamous member
of this latter group claims his only technical skill is knowing how to fill out
a UPS shipping label to return his radio for factory service.)

The amateurs who still embody the spirit with which amateur radio started
are those who as a child took apart every mechanical thing that they could
(and sometimes got it back together too). They are the ones who are intensely
curious about how things work, and who avidly try every new technique that

comes to their attention simply for the joy of trying something new and different. Their skills are constantly expanding because they can't stop themselves from learning new things. Exams mean nothing to them, what they can *do* with their knowledge is all that is of interest. They generally are eager to share their knowledge with anyone who will listen, and are glad to have others join them in their exploration of the exciting activity called amateur radio.

Sadly, too many people lose this child-like sense of wonder and curiosity as they grow older, and become fossilized in their thinking and attitudes. Too few maintain this eagerness to explore new avenues, and forget what it felt like if they ever had it. And even more sadly, these fossils do their best to keep out those young in body or in spirit who retain this wonderful gift. Their motto is "No kids, no lids, no space cadets.", just grumpy old men who once beeped fast.

The average General today is 63 years old. There is a desperate need to inject some younger blood into the class, to regain some of that sense of excitement and adventure that those looking at this aspect of amateur radio with fresh eyes can bring. To that younger generation, growing up in a world of modern communications, Morse Code is a quaint antiquity like the hand crank starter or the buggy whip. Its over-emphasis on the amateur exams is a major turn off. It sends the message that receiving Morse Code rapidly is the highest aspiration of an amateur. I hope few amateurs believe that's true, but I'm afraid too many do.

>(lack of storage and/or var persist on most models hobbyists are likely
>to own).

Heyward assumes that any amateur experimenter interested in a spectrum
analyzer will already have an oscilloscope. That seems reasonable to me.
And with a 30 kHz filter, sweep speed can be 330 microseconds per division,
which is fast enough to prevent flicker, and allows realtime amplitude
response for observing dynamic signals, or for tuning filters.

>Why doesn't he just take the ramp output from the scope timebase?

That would require modifying the shop oscilloscope. With this design
you can vary the amplitude of the X axis feed to expand the display,
and vary its DC offset to center any part of the spectrum. You couldn't
do that if you were using the scope as the timebase.

>And
>how does he linearize the VCO? (That's another thing that's awkward in
>hardware and trivial in software.) Guess I need to hunt down that issue
>and see what the various rationales were...

No need to linearize it. Since the X axis is slaved to the oscillator, what
you see is what you get. There is no pretense of calibrating the X axis
linearly in terms of frequency. You can use a marker generator to see
where you are in the spectrum. With a minimum bandwidth of 30 kHz,
you don't need very fine calibration anyway. You can also center the
signal of interest and set zero span, then read the LO frequency with
a counter. Heyward says convenience was sacrificed to get high
RF performance at low cost and low complexity. Requiring a $2000
Pentium II PC would defeat the purpose (and would fill the shop with
computer hash which would impair the ability to do RF measurements).

And QST recently published a PC based scalar network analyzer anyway,
which was really just a very slow sweep speed spectrum analyzer with
tracking generator. Cute, but not very useful for realtime dynamic signal
measurements. Heyward's instrument is useful for observing harmonics

of an amplifier due to dynamic clipping. I don't think a PC based instrument would be capable of that.

Now don't get me wrong, I'm not likely to sell my Tek 491 and build this instrument. But for someone who doesn't have any spectrum analysis capability at all, this is a cheap and easy way to acquire it. And it won't be plagued with the spurious responses of the cheap instruments based on TV tuners.

I havent been following this thread, but here's one of my favorites for cleaning goo and glue from old equipment.

The "Tar and Bug Remover" sold in auto parts stores.

Its not strong enough to hurt plastic or paint, but it desolves most of the stuff I want off. With some rubbing it usually even gets off marks from marker pens. Follow with a little soap and water to remove the solvent.

I hope you regen fans out there spotted the excellent article in the July 1998 issue of "Electric Radio" on Regen receivers. Bruce Vaughan, NR5Q, describes his version of a 1947 RX called "The Old Stand-by" by George D. Knipe, W7IGE. Bruce also shares a lot of hard-earned wisdom on regen construction.

I was particularly struck by his description of the mysterious "black art" aspect of regen construction: "If you follow the diagram fatihfully, if you adjust your voltages correctly, and if you do a perfect wiring and soldering job, the results will not duplicate my receiver. Your receiver could very well work better, and it may not work as well. I've built two dozen receivers using this basic circuit and no two sets work the same."

Do you have Q-meter measurements to back that statement?

The silver plating debate a few weeks ago contained similar statements that it would be better to varnish copper parts than to silver-plate them. That's easy to say, but without real Q-meter measurements it's only words.

There are so many formulations for glues/lacquers/varnishes/dopes, and they cannot all be equally good at RF.

Radio Shack is a chain of electronic stores here in North America. Most of what they sell is consumer equipment ike stereos and computers, but they do carry some electronic components. What parts they carry seems to be chosen at random at times. Sometimes they have some really interesting IC's that would be hard to find elsewhere, yet common parts are missing.

The reason Radio Shack gets mentioned so many times in North American magazines and books is that Radio Shack stores are very common, and even small towns would probably have one. So you see their parts numbers in construction articles often.

But in virtually all cases there is nothing special about those parts; you should be able to get them elsewhere. If an schematic in a magazine or book only lists a Radio Shack number, someone is failing at conveying information. It's rather like in the old days when you could get B&W or Airdux pre-made air-wound coils, and the schematics would list the part number rather than the detail. It's fine if you can afford the commercial coil, or can get it easily, but the lack of details is not helpful to those who want to make their own. The common part number for an semiconductor should always be listed (though there's nothing wrong with also including a substitute), and even Radio Shack specific items like boxes should include the dimensions. The way to fix that is to make an issue of it.

I don't think Radio SHack does mail order. Their head office is in Texas; something like Fort Worth. They have a website, but I can't remember the URL. In North America, you'd pick up a catalog at the store when it comes out. Maybe you could arrange to have them send you a catalog so you can look up the part numbers for details. Or maybe someone in the US (most likely that's where the schematics are coming from, and the numbers or stock might be different in other countries) could send you one.

One bad thing about Radio Shack besides the limited range of components is that the prices can be quite high. People are much better buying elsewhere, but that isn't always so handy and often elsewhere you have to order more than a certain amount.

The filters are LP and HP....ONLY at the CROSSOVER freq will the
antenna common Z be 25 ohms (but thats assuming the filters BOTH
pass it..which they DONT! The crossover freq will be at least 3-10db
down from insertion loss....its actual impedance will
not matter)...

Check out ANY Diplexer....all they are is 1) LP filter with a CUTOFF
above the highest freq needed ...of course you want the loss at
the highest freq to be less than the 3db for the cutoff freq!...and
1) HP filter with its cutoff BELOW the lowest freq needed....
and BOTH filters are made for 50ohm In-out....

Your statement would be true ONLY if the 2 filters are connected
together at BOTH ends....which they are not...ALL three ports are
50 ohm ports....the filters are simply made using 50in/out as
nominal impedance.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I have "zapped" some CRT's in the past with a fair degree of success.
Was able to extend the usable life of the tubes by a couple of years in
most cases, if they were caught just as they were starting to show
their age (slighty visable lowered emissions).

Now I havn't tried this, but wouldn't it be possible to do this to
regular type tubes? Seems that some extended life could be possible
out of some of these very expensive 8950's, 6JE6/6LQ6's etc.

Comments please? Please post responses to the group(s).

: on overnight.

Another possiblity is WD-40(or any clones of it-they are many of them).
This WILL leave a oily film behind.
Also, plain old kerosene often works well(and it's CHEAP).
For really BAD gunk, 1,1,1 Trichlorethane(used as a degreaser/spot
remover/film cleaner), among other things.
Is a great cleaner-but it may be rough to find depending on where you
live.
NOTE:this stuff is safe on MOST plastics, but it eats polystrene(and
similar plastics) for LUNCH..so try in a hidden spot first!
And open a window...the fumes are not deadly, but they won't do you much
good either.

Body handling: Binary attachment payload not displayed: vcard.vcf

Hi,
I did homebrew my own GC receiver.
The trick is to do it using available parts. Since I used some strange parts it also has bit less straight forward
design. The ARRL -96 handbook had schematics for many of the needed circuits.
Some characteristics:

Input filters:
4 block filters switched with analog 40HC66 switches
(No intermodulation problems with a 25 meter wire antenna).

1st mixer:
23 dBm doubly balanced mixer

1st IF:
10.7 MHz Monolithic crystal filter BW=15 kHz connected directly to the mixer with a 10,7 MHz IF transformer.

2nd mixer:
BF981 Dual gate fet.(This is the first amplifying device in the signal chain, sensitivity is good enough)

2nd IF AM:
455 kHz Murata filter, BW=4 kHz -3 dB, 8 kHz -80 dB

2nd IF SSB:
9 Mhz SSB-electronics filter, BW=2.2 kHz -6 dB, 4 kHz -80 dB

The synthesier is based on a Permeability tuned oscillator from a Drake TR-3 from the sixties!
Because the first IF is so low, low-noise HF covarage is achieved with only 2 VCO's

All is built using the dead bug construction technique, except the frequence display which is a factory made
CMOS unit from the beginning of the eighties, which happened to have a shortwave input with a 10.7 MHz IF offset.
Sadly these are not manufactured anymore.

Thanks for the tips. I probably need to buy a new handbook (mine is '89, so some of the ckts probably use some hard to find parts. Did you find it ok to have no rf amp or attenuators on the very low end and very high frequencies? I havent messed with receiver ckts in a few years and was also hoping to find improved ICs for the freq. synthesis. Maybe there is something in newer Handbooks. I'm not familiar with the Drake scheme you used, but in general, I have also been worried about trying to shield and filter the digital sections to prevent self interference.

Well, if people want a spectrum analyzer, or maybe an sa/scope mix, you could always get an old scope and build the spectrum analyzer into the existing case, with a small switch to go from oscope to SA and back...

> What can be done to get the headset to work with the 202 and still work
> fine with the Icom stuff?
> Grant KB7WSD
> ghopper@eskimo.com
==========
May I suggest you first find out which pins on the head set plug are
the PTT (push to talk) Then find the socket pins on the HTX-202 and
make a patch lead (4-6 inches is probably sufficient) with plug to
suit the HTX-202 and socket to suit the headset and insert it between the 2 .
Now you can use the headset with both the HTX-202 and the ICOM radio.

Good Luck !

Chuck:

You must not be looking very hard, the ARRL handbook in ALMOST any year contains an HF amp of one type or another. Many local librarys have older issues chock full of 3-500Z plans, 811a, etc. There is a company out of Ohio called Communicaton Concepts, they had HF amps to 600 watts, you bring the power supply they have the board, finals etc.

705. RF design software, DSP

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-27 00:00:00 UTC
From: JACK DOYLE <n9ogk@csj.net>
Message-ID: <35BCF40B.445E@csj.net>
Source record: 80845

Anyone know where I can get some fully functional (freeware) circuit/RF design software that would rival the performance of MicroCode's CircuitMaker 6 PRO?

Also, I'd like to know more about DSP; where can I be able to get information (other than the handbook) on DSP design in receivers? The reason being is that I would like to know how I would be able to get selectivity out of a direct-conversion receiver that is using DSP just before demodulation that would rival some of the best quad-conversion receivers.

I have also been looking around for DSP simulation software, and found some demos at Hyperception, but I didn't think it would exactly fill my needs for the application that I am thinking about.

I am not yet building my project, which is an HF transceiver, only trying to get ideas for designing said radio.

any input will be greatly appreciated.

707. Re: transverters

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-27 00:00:00 UTC
From: Woody White <"eMail "@my.www.page.Mailto>
Message-ID: <6pja2f$84o@bgtnsc02.worldnet.att.net>
Source record: 80847

Almost all transverters make the actual frequency conversion at low power levels. ...10s of milliwatts or less. The (Tx) driving signal is usually passed through an attenuator. With this built in attenuator, the transverter typically will still only require a few watts drive - The exciter maximum power out must be set accordingly. The desired output frequency must be amplified in the transverter from a few milliwatts (or less) to the desired output. Many transverters stop the amplification at the 5-20 watt level. Probably economics and market demand, more than anything else, determines this... External amplifiers are available to raise the output level. Sometimes to minimize transmission line loss, the external PA (and Rec preamp too) are mounted remotely, near the antenna.

Have read a review of the TenTec units and it was gennerally good. Have also heard them on the air (6M) and they sound fine. Most transverters are linear (not all) and will work fine on SSB. The TenTec is one....

>On Sat, 25 Jul 1998 22:25:34 GMT, jdaggett@gate.net wrote: (stuff deleted)

Hello Gary--

Like many, I've been entertained and educated by your many messages on this newsgroup related to technical issues. However, this more emotionially charged posting is somewhat disturbing to me. You seem to be defining good and bad people in our hobby, and through accident or design I find myself on the bad side with regard to a couple of attributes. As I understand it, the bad guys are--

Owners of Japanese equipment.
CW Operators ("those who've learned to imitate a modem")
Non-technical hams
Old White Males

Here's how I rate:

Jap equipment--

I've recently (past 20 years) owned, in this sequence: Ten-Tec, Ten-Tec, Yaesu, Ten-Tec, Yaesu. The Ten-Tec stuff was all great, the first Yaesu was terrible, the current one I like. Would I be an OK guy if I still owned Ten-Tec? Even if I didn't understand what goes on inside it?

CW Operators-

I don't know how or why but I just gravitated toward it. I always figured it was about as significant as the fact that I like Fritos and play the banjo. But then I got on the internet and found out that my inclination marks me as somehow sinister. Does it help that I like RTTY a little? But I admit that I do prefer text modes.

Non-technical hams-

I do some building--more than operating actually--but there's no way I can measure up to the technical level of the top builders posting to this newsgroup. I'm OK on digital stuff and pretty good at assembly language, but RF is still magic to me. I'm not sure where I stack up here. You'll have to judge my accomplishments or give me a test or something.

Old White Males-

You didn't say what's old, but I'm turning 50 this weekend and I'm white to boot. I can apologize for these accidents of my birth but I can't change them. I too would like to see lots more teenagers coming into the hobby. More minorities, girls and women would be fine too.

Anyway, your central point seems to be that CW shouldn't be a licensing requirement. OK, we'll come to that eventually and it might as well be now as later. But I'll dispute some things your posting implies--

The idea that we'll get less hams who engage in inane conversations and/or want to substitue ham radio for CB or cell phones without the CW requirement. I'm sure we'll get more.

The idea that it's the hated CW Ops who are technically incompetent and who engage in those QSOs you deplore. Where's your data to support this? I propose that it's your contempt for CW operators that leads you to this conclusion without any information to support it. Ask anyone where the most egregious examples of offensive QSO content is and they'll tell you 75 meters. Is that a CW sub-band? To check out my new Yaesu, I recently tuned to a SSB sub-band and the first thing I heard was a guy broadcasting a ham radio call-in (telephone) talk show! Is this part of your grand vision for ham radio?

I'm a little shy about judging the value of someone else's QSO, although privately I share your disdain for some of the stuff I hear. Still, I've engaged in lightweight RST/NAME/QTH QSOs, signal report and section contest QSOs, NTS net QSOs, signal-report-and-section DX QSOs. There's something in there for everyone to hate.

As for your implied contention that being a CW operator indicates a lack of interest in the technical side of the hobby--consider QRPers. Because of the simplicity and effectiveness of CW many of them are building CW rigs. These radios may not be extreme high-tech, but surely you'll allow for a beginner's level as better than nothing. (Won't you?) I suspect you already knew this but choose to disregard information that contradicts your conclusion.

Gary, thanks for all of your technical postings. Thanks for your opinion that CW should no longer be a licensing requirement. But I wish you'd rethink your overall contempt for CW ops and old white guys like me.

I have been using an HTX-100 as an IF rig for transverters for several years now. It has a high-power position (25 watts) and a low-power position (5 watts from the factory but there is a pot that can be adjusted to crank it down to 2 watts). I use the "microwave transverter IF switch" design by Zack Lau, W1VT, which appeared in QEX magazine several years ago. This brings the 2 watts of the HTX-100 down to an adjustable -15 dBm to +3 dBm range -- just right for most transverters. I've been considering "fixing" the HTX-100 power level switch so it is only in the 2-watt position, but so far I haven't bumped it into the high-power position while operating. Besides, I keep thinking 10 meters may live again so I can use the rig on 10 meter mobile!

My 6 meter, 2 meter and 70 cm transverters run directly off the 10-meter output of the HTX-100 (with a built-in IF switch in each). I built amplifiers to bring the power of each up to the 10-watt range. For the higher bands I built a separate 2-meter transverter with an output of about 0 dBm. This works with my 903, 1296, 2304, 3456, 5760 and 10368 MHz transverters just fine. These are all homebrew transverters (mostly the KK7B/DEM designs).

With my systems, I haven't really needed more power than 10-20 watts, as I've been able to work almost everything I can hear with this power level. If you're looking at EME or meteor scatter, you WILL probably

need a few hundred watts, at least. But I haven't gotten into that yet
and don't see those as propagation modes a beginner is likely to be using.

Icom headsets use a 10k leaky PTT resistor. That's marginal with the
HTX202, some will work with it, some won't. You need to reduce the
value of that resistor to something that will reliably key your radio.
Yaesu radios require 2.2k, and that works just ducky on the HTX202
too. Audio level will be down a little bit when you use it with an Icom
radio since the line is now loaded a bit heavier than the radio expects.
Just crank up the audio a bit and it'll work fine there too.

Hi,
I have no problems with sensitivity, it is limited by antenna noise.
I quess the noise figure is somewhere between 15-20 dB.

One problem with advanced IC's for freq synthesis is that a microcontroller
is required to control them. But if you like working with those then it's OK.
Then you would need a input device for frequency settings also (Shaft encoder =
expensive).
I prefer to use an analog VFO based synthesis instead. Just find an old tube rig and
take out the VFO. As a bonus the IF filters and carrier crystals may be usable as well.

I use normal 40HCxxx for the digital logic in the synthesizer. There is also some
mixing and filtering
involved. The divider is a fairly new chip called 40HC103. It is eight bits and
has synchronous reset. I use 40HC192 UP/DOWN counters to program the divider and
select the 500 kHz segment. The analog VFO the tunes within that segment.

I have some birdies due bad grounding, but since they are tolerable I have bothered to
do
anything about it. Anyway good shielding and grounding and selection of oscillator
frequencies are the key to
no birdies.

Actually I should do a WEB page about my reciever, but I have been too lazy.

Mike

Hi,
Does anybody here know about any usable tools for
drawing circuit diagrams and publishing them on the net ?

Many circuit digarams I have seen on peoples home pages
are scanned hand drawings. They dont look particularly good.

73 de OH2AUN Mike

I use MS Paintbrush. I then convert the (large) file to a much smaller
.gif file. The results are quite good, as can be seen from my Project
Page (URL below).

But did you *look*? It certainly isn't expected that everyone be a technical
whiz, but a bit of curiosity about how it all works is a healthy attribute of
an amateur. It doesn't matter what the country of origin of your equipment
is, its just that most of it comes from Japan these days. What matters is
how you view it. Is it an incomprehensible box that you just *use*, or is it
something that you have an inkling about how it works, and are interested
in finding out more? Do you boast that you know how to fill out the UPS
label to ship it back to the factory for repair, or is it slightly embarrassing
to you that you have to ship it back to the factory for repair?

Operating CW isn't a bad thing, even *liking* it isn't a bad thing. What's a bad thing is believing that Morse Code speed is the defining factor in what makes an amateur. And what's a bad thing is attempting to use Morse Code speed testing as a gatekeeper for amateur privileges (most of which bear no relationship to Morse Code). Go back and reread what I wrote, I think you'll find that I didn't express disdain for those who operate CW, I expressed disdain for those who have exalted Morse speed *testing* to a position it does not deserve.

>Non-technical hams-

>have to judge my accomplishments or give me a test or something.

The important thing is the interest. It doesn't matter whether you're better than others here or not, only that you're better than *you* once were. You're the only yardstick against which you measure yourself. Are you improving, or are you stagnant? Don't worry about the rest of the world, just your own progress. If you don't even *try* to learn more, if you've forgotten what you memorized to get your license, then you should be embarrassed.

>More minorities, girls and women would be fine too.

Yeah, we can't help when we were born, or the genetic heritage our parents gave us. We can pick our friends, but we don't get to pick our parents. More youth, and more diversity, are important to the future of amateur radio. We need to more closely reflect the world we live in, but that includes old white men too. It should embarrass us that amateur radio has demographics that more closely align with the Klan than with the general population though.

And our demographics are shocking in that the average age of a General licensee is 63. It should be closer to 35 if our demographics were a healthy representation of the general population. And of more immediate concern, the average age is going up at nearly one year per year. That means we aren't bringing in enough young people to keep the average age stable. That's dangerous, it means we have a dying demographic because that average age will soon reach the average age of mortality if we don't do something to turn things around. Or put more bluntly, in 10 years half of our Generals will be dead. I think the ARRL has finally woken up to this cold hard fact and has taken a timid step to do something about it.

Our other classes aren't doing all that much better. Only Tech
has seen a decline in average age in the last 5 years, and that's
still 43. Novice used to be our youngest class, but now it is 49,
and class growth is mortibund. The overall average age for all
US amateurs is 59. That should scare people. I know it scares
me. When I became an amateur in 1963, the average age of
all amateurs was 29. Most of the people getting into amateur
radio then were in their teens. And scads of them were getting
in. That's stopped, and it largely stopped beginning in 1968 when
suddenly you were worth no more than a bucket of warm spit
if you couldn't pass a 20 WPM Morse test.

>Anyway, your central point seems to be that CW shouldn't be a licensing
>requirement. OK, we'll come to that eventually and it might as well be now

>
>The idea that we'll get less hams who engage in inane conversations and/or
>want to substitue ham radio for CB or cell phones without the CW
>requirement. I'm sure we'll get more.

I didn't advance that idea. The law of large numbers says we'll get all kinds.
We always deal in bell curves when dealing with populations. We'll get both
wheat and chaff. The thing is we don't know how to winnow them a priori.
Some of our brightest lights arose from unlikely beginnings. No test that we
have can reliably determine who will fan into flame after being exposed to the
spark of amateur radio. Some will, some won't. If we have to accept 100 who
won't to get that 1 who will, it is worth it.

>The idea that it's the hated CW Ops who are technically incompetent and who

>to a SSB sub-band and the first thing I heard was a guy broadcasting a ham
>radio call-in (telephone) talk show! Is this part of your grand vision for
>ham radio?

You're certainly reading more into my post than was there. It is true that I
view CW as a creaky inefficient antique, so's AM, so's fencing and musketry.
If people want to play re-enactor with any of them, however, that's no concern
of mine. Where it becomes my concern is when they insist that Morse Code
speed is the defining characteristic of an amateur and co-opt the government
into backing that notion with its force.

What's of interest about 75m is that every one of those offensive characters
has passed at least a 13 WPM Morse test, and many of them have passed a
20 WPM Morse test. The vaunted ability of Morse speed tests to serve as LID
filters obviously doesn't work. And why should it? A Morse test tests Morse speed,
nothing else. If you want to assert that operators in the digital portions of HF bands
using CW are more polite, I might agree with you, but that has nothing to do with
the issue of testing. Once the tests are over, the choice of operating mode is
completely optional. I'd also suggest that some of that apparent politeness is

due to the terse and stylized nature of CW. And it takes so long to swear in CW that it loses its emotional impact, so people don't bother. But they do find time to send strings of dits over a RTTY transmission, or swish a carrier back and forth across a PACTOR contact. SSB has no monopoly on LIDs. And while we're speaking of LIDs, they seem to overwhelmingly be older white men too. You don't hear many kids or young ladies engaging in the sort of behavior I'm sure we both deplore. If we had more kids and ladies, they might have a beneficial effect on the rest of us.

>I'm a little shy about judging the value of someone else's QSO, although
>privately I share your disdain for some of the stuff I hear. Still, I've
>engaged in lightweight RST/NAME/QTH QSOs, signal report and section contest
>QSOs, NTS net QSOs, signal-report-and-section DX QSOs. There's something in
>there for everyone to hate.

Again it is true that I am not fond of contests, and find Dx pileups generally repugnant. I have a few friends who have literally been hounded off the air because they happen to live in a "rare one". Until you've lived somewhere where it is literally impossible to get on the air without a pileup ensuing, you can't understand how awful that can be. But if conducted with a little dignity and respect, I can't get too worked up about radio "sport". If nothing else, it serves to test the overload resistance of our receivers. As an ex-NTS net control, I can see the training value of that activity. At least it teaches a little discipline, a quality too rarely exhibited by contesters or Dxers who remind me too frequently of a pack of hounds worrying a stag to death.

>As for your implied contention that being a CW operator indicates a lack of
>interest in the technical side of the hobby--consider QRPers. Because of
>the simplicity and effectiveness of CW many of them are building CW rigs.
>These radios may not be extreme high-tech, but surely you'll allow for a
>beginner's level as better than nothing. (Won't you?) I suspect you
>already knew this but choose to disregard information that contradicts your
>conclusion.

Indeed, many QRPers are builders, but after you've built your 27th MOPA rig, aren't you getting a bit stale? I build QRP equipment myself, but I try to do something a bit more interesting than the same old CW rig. A varactor is 15 cents and a PIC costs 2 dollars, cheap high performance subsystem chips abound. Must we remain beginners forever? And does it even make sense to begin with discretes anymore? But I applaud anyone who takes soldering iron in hand. At least they're trying to be something more than a radio user.

>Gary, thanks for all of your technical postings. Thanks for your opinion
>that CW should no longer be a licensing requirement. But I wish you'd
>rethink your overall contempt for CW ops and old white guys like me.

I don't have contempt for people because they are old. We all get old. But I am concerned that it doesn't bother us that nearly *all* of us in amateur radio have gotten old. We should be worried that we aren't seeing young people entering in droves. And we should be trying to do something about it. And I don't have contempt for CW operators,

but I do have contempt for people who proclaim that Morse Code speed is the defining characteristic of an amateur. And I do have contempt for those who would use Morse speed testing as a way to restrict access to their exclusive club. I have no desire to euthanize our elderly, I don't want to march our CW operators off to the gas chambers, but I do think that Morse code speed testing has an undeserved exalted position in our amateur *testing* system.

In fact our entire testing system and license class structure is wrong headed. We've created a system which proclaims to the world that the highest aspiration of an amateur is to emulate a modem using an inefficent modulation and poor coding at higher and higher speeds. The technically astute in the population must just shake their heads in wonder, and the less astute must surely be baffled at what Morse speed has to do with operating phone on subband segments of HF.

I'm not a chemist, but I'm pretty sure that plastic drink bottles aren't polystyrene. But styrofoam is, so you can dissolve styrofoam cups or some of those pieces of styrofoam packing material that lots of things come packed in.

Although lots of different plastics dissolve in acetone, polystyrene has much better RF properties than just about any other. The only common plastics I know of which are about as good are polyethylene and PTFE (Teflon), neither of which dissolve in hardly anything including acetone, and polypropylene. Polypropylene is readily available as the floating rope you can get at any hardware or discount store, but the coloring and other stuff they put in it might affect its RF properties. I also don't know what it dissolves in, and with the ready availability of styrofoam and acetone, it hardly seems worth the trouble to find out.

We used to have these discussion years ago, when people wanted a
no-code license.

What buggs me is that quite a few wants full privileges all at once!
OK let them have it! But I bet my last penny that 80-90 percent out of
those would drop out of the hobby within a few years.

Learning code might be difficult for certain, and so is tech stuff for
others! But I INSIST there must be some sort of barrier to climb, one
must acheive something, otherwise the so called amateur license is
just another paper! Nothing to be proud over.

20 years ago I friend said: OK lets have 12 or 16 wpm code test, but
if someone is smart enough to construct a CW decoding machine (pre-PC
era) then let them try it! A person that is this smart is "well-worth"
to belong in the ham-ranks.

For me the challenge to learn more, upgrade to next level was exciting
and FUN, not just an obstacle to get over. I wish there were more
levels, as this is a great way to improve one's knowledge!

OK so thechnology moves ahead, and CW becoming a just a sort of
nostaligia (but FUN!... Gee I am sounding like Wayne Green), lets get
more technical. Buying the latest super-duper radio and not beeing
able to wire the computer-interface, well shame on you!!!!

Those who just want to find the mike on the messy desk and shout rude
words, go to 11 meters.

Oh gotta run, there is a nice DX on CW
C.U.

Most of them are made of PET (Poly-Ethylene-Theraphtalate).

But don't use a used cup. Coffee might have strange effects on RF... :-)

If I remember correctly polystyrene cement is used when putting
together small plastic airplanes (AirFix...).
Why not just use that to hold the windings in place (without any modifications) ?
Check the nearest toy store.

728. 144 MHz RF Amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-28 00:00:00 UTC
From: Richard Hosking <richardh@iinet.net.au>
Message-ID: <01bdba35$7e230820$LocalHost@default>
Source record: 80868

- Gday All
I have designed an RF amp for a quality 2 M receiver for repeaters, usding softwre from KD9JQ and manufacturers s parameter data. Unfortunately the amp did not perform to spec. It uses a helical filter on input and output- these are nominally 50 ohms - but I wonder if they are a proper match. There is a matching circuit on input and a broadband transformer on the output matching the helical filter. I need the following specs
NF good (?< 1 dB)
Output +12 dBm
Gain around 20-25 dB.
Has anyone any thoughts?
Thanks in advance -please E mail to richardh@iinet.net.au

729. 144 MHz RF amp

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-28 00:00:00 UTC
From: Richard Hosking <richardh@iinet.net.au>
Message-ID: <01bdba36$dea99d20$45003bcb@default>
Source record: 80869

I am looking for a design with the following specs
NF <1 dB
Output +12 dBm
Gain 20-25 dB
I have tried designs from the KD9JQ software but cant get the power out
I am using helical filters on input and output which are nominally 50 ohms
but the match may not be correct
Anyone got any ideas/circuits?
Thanks reply to richardh@iinet.net.au

I use Number One Systems' EasyPC Professional XM software for schematic
entry and PCB design. I output the schematic to an HPGL plotter file and
convert the HPGL to a .PCX file with a shareware utility called PRINTGL.
The .PCX file is then converted to a .GIF using Corel Photo House, for
incorporation in the web page. The process is a bit involved, but works
OK.

I have a 2 meter converter for a receiver with a 28-30 MHz tuning range.

It's a Vanguard Electronics Lab, Dual Gate MOSFET converter with BOTH crystals for full band coverage. Requires 12 volts. In very good condition with a few smudges on the case that I think will polish right off.

This was a very hot converter in its day and is a perfect "period" complement to receivers from the 60s and 70s. I bought it years ago and never did use it.

$35 shipped to you. $40 if you wish UPS COD.

Ian, K6SDE

Yes, I think it would make a great page. I was actually surprised that I
found no pages along these lines. And not too much responce to this
querry either. I just started playing with microcontrollers, so maybe
that woulnt be too much problem to incorporate one in the tuner. I hadnt
thought about the expense of shaft encoders. I wonder if one could use a
keypad. Maybe some pushbuttone that provide jumps of 100khz, 10khz, 1khz
and so on. Or maybe have them all do fixed small jumps, but at different
speeds.
Did you get the digital logic circuits out of the handbook, or design
your own?
Don

738. Update available to Homebrew DGPS Receiver Project

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-28 00:00:00 UTC
From: bix@san.rr.com
Message-ID: <35be618a.58000465@news-server>
Source record: 80878
Cross-posted to: sci.geo.satellite-nav,rec.boats.electronics,rec.radio.amateur.homebrew

A while back I published the documentation for a homebrew DGPS
receiver on my web page http://home.san.rr.com/bix

I have modified the DGPS receiver documention. Christophe Lamy has
come up with a fairly simple software modification which changes the
coverage from 285-325 khz with 1 khz channel spacing to the official
marine beacon band of 283.5-325.0 khz in 500 hz steps. He has also
modified the LCD initialization code to yield a more robust startup
sequence.

Also, there is an error on the processor schematic -- four of the LCD
bits are reversed on the schematic. A rev A version of Processor.pdf
has been posted.

I have also added a page for collecting notes from my own and other
experiences with the receiver. If you sent me a comment and I didn't
get it on the notes page, I probably will in the next few weeks, as I
go thru my email archive.

You can access the notes and the new software starting from my home
page, http://home.san.rr.com/bix

I am generally positive about the new restructuring for the following reasons...

If we want to have any weight when it comes to our frequencies, then we need to have the numbers.

God knows that the morality of this nation is crumbling, and it is seen on the TV as well as heard on our precious few frequencies... We might not be able to "test" someone for his moral values. CW might have been a shallow indicator of someone with enough determination (an antiquated American character quality) which was often exhibited in a fine moral person.

I don't think we should throw code out completely... but I think it is such a valuable skill that every HF op should have a minumum aptitude for it. Why do we learn the code... is it so that we can have fun spending half an hour saying something that could be typed in 5 minutes or spoken in 30 seconds... NO... we learn the code because sometimes it is the only mode that will make it through the QRM/QRN/QSB... (I've personally tried to make some contacts on SSB and digital that failed... but the CW made it through ... PLUS anyone can put together a CW rig in an evening for less money than an HT!!! ham radio doesn't have to be an expensive hobby!!!)

WE AS AN AMATEUR RADIO COMMUNITY need to recognize the following...

Within many communities/counties of our nation, the Civil Defense/Sheriff's/Police/EMS people are moving to new, expensive systems that boast wonderful capabilities of encrypting and rerouting their messages... WHEN THOSE SYSTEMS FAIL... (because some disaster - natural or otherwise) ... who are they going to turn to? All it takes is a well placed lightning strike, a tornado taking out the county's main radio tower...

Do you know why they are moving to these new systems? They are trying to become self dependant (not necessarily a bad thing), but they are sold a bill of goods that creates a new sense of independance and self-reliance that is causing them to shun their need for working with ham radio operators in their community.

They also shun amateur radio because it doesn't take much to see that 90% (my rough guess) of the hams are retired and NOT in a position (physically, mentally, or emotionally) to weather out a true emergency (i.e. 72+ hours without power... not to mention a month! have we all ready forgetten our friends in New Zealand and Montreal who lost power for a VERY LONG time!??).

PLUS- anyone with a scanner or shortwave receiver can listen to the trash that amateur radio operators put out... they see us as a undisciplined bunch of operators not much more reliable than CB.

We need to develop a new mindset...

Amateur radio has boasted for the last half a century it's value in emergency communications. Why won't our county sherriff recognize the amateurs in our community? Do they think we are just a joke and are just a glorified group of CB'ers?

They will only see our value when their equipment fails them. And when it does fail them... you need to be prepared. You need to become more dependable than their centralized communications system. This means having equipment and supplies (food, water, shelter, etc) to be able to go for a week without power. Everyone in your amateur radio community should be able to do that... plus there needs to be a well trained pool of operators that understand something about net discipline and traffic handling. Why traffic handling? Traffic handling is a discipline that forces you to put down extra information involving the source of the message and some other vital information. It's not enough to just send your message. Our true "professionalism" will shine when we develop this discipline. Discipline is something lacking in our youth (and many adults)... it's hard to do... but it will pay off in the end.

We can't sell people on the International Communications bit any longer. Anyone can buy a pc and get on the Internet (nothing wrong with it... it's useful as we all know)...

BUT where ham radio really shines is when the power and telephone lines go out... that's when we can use the radios to help. But how many of us are really prepared to help? (Do you own a generator? When was the last time you checked it? You know it's awfully hard to pump gas when the power is off... do you have enough fuel to last more than 6 hours? What about batteries? Have you ever considered purchasing a small 5 watt panel to keep a deep cycle battery charged for your ht - just in case you ran out of fuel... we need to prepare for worst case here folks because our ems/c.d./ema/fema people aren't going to be there to help us out when they are scrambling to feed their own mouths and keep their generators running)

Here's my view of what's in store for ham radio.

The only true positive contribution amateur radio will ever have is emergency communications. If you want people to see the positive aspects of ham radio, they won't begin to notice it until their lights and phone lines are dead. When they can't check their e-mail, browse, and chat... they will be starving for communication!!! (Try to see if you can go for just a few days without Internet access or a working phone. How many of your friends or loved ones would be able to communicate with you on the radio - work with them and get them involved in the hobby)

Natural disasters are occuring with a marked increase in our nation. With the tremendous strain of heat acting upon our power grid, how much longer do you think the lights will stay on in your house?

If we are going to "sell" amateur radio to the general public, it's no longer going to be - "Here's a neat way to talk to someone in Europe/Africa/Asia..." instead it's going to be... "Are you concerned about an emergency situation that might strike your community? Here's a good way to make sure you can stay in touch with your friends and loved ones while the utilities and phone company are scrambling to fix their downed systems..." (btw... how many of you are truly aware of the y2k problem... visit www.garynorth.com and wake up to the facts people ... less than 76 weeks to fix a problem that can't be fixed for maybe a decade... everything in our society is so interdependant - it is a house of cards ready to come down!)

If you want to have quality people in the hobby... go out and get them interested in the hobby. If you know some kids involved in home schooling... they'll eat up ham radio. Most home schoolers are people with slightly higher morals than what the gov't schools are turning out now. Do you go to church? Do you know a good family with young people who like technical things or are interested in science? Get them hooked on radio. Besides ... most home schooling parents are looking for some one to help out in training their children in science/math/technical things.

I'll bet that most of the sour apples in our hobby aren't promoting the hobby... they are too selfish with their time to help get some youngsters into the hobby. Are you retired? Do you want to see some fresh "good" blood flowing in our hobby? You need to take some initiative and find some "good kids" that are dying for some attention and someone to show them something good to do with their time (other than vandalizing buildings, and breaking in and burglarizing).

But the selling point is no longer "talk to far away places". It's now - learn valuable skills that will help you help others in an emergency. It's that spirit of serving our communities that needs to be instilled in our young people.

In finalizing... once we as an amateur radio community make the radio hobby a valuable commodity by disciplining our selves (our operating habits, cracking down on radio scum) and work on our emergency preparedness training (our MOST valuable commodity to our communities) - and begin to make a complete turn around in how we promote radio (its educational benefits as well as it's communication capabilites in hard times) then we may very well begin to see another generation of hams that will shine as once did that generation that helped us get into the hobby.

It's time to give back to a hobby before it's too late...

If you read this far... thanks... 73 to all of you and hope to see you on the air.

Daniel/AA0NI

Do you know someone who wants to study for their license but doesn't want to shell out the money for a book just yet... have them visit my web-page (still under construction) www.qsl.net/aa0ni/index.html - there they'll find some introductory lessons to the concepts that every amateur operator should know ... and needs to know in order to pass the test and get on the air.

I'm doing this because there's two major groups making a bundle off of ineffective textbooks- you'll never be as effective of a ham when you memorize the questions, and another certain organization sells a book that does a VERY POOR JOB of introducing basic concepts before they are mentioned in Chapter 1 - e.g. How are students supposed to understand what these "frequency limits", "meter bands", and "modes" are when they have no concept of frequency, wavelength, and the various modes available to us? Yet they've been selling us the same trash for the last 12+ years!!! Ham radio should be as inexpensive of a hobby as possible and yet shouldn't use such slavish educational techniques as is present in these so called "self-study" texts.

That's why I'm working on these lessons. www.qsl.net/aa0ni

I suspect you will be better off using a design with less gain and less output but a good noise figure, followed by a higher power stage. You can get 12dB gain and sub 1dB NF from devices like the BF981, many designs available.

You can also get impressive figures from microwave Power HEMTs with cavity input stages. Designs are given in Dubus, the 4th technical compendium is a good place to start.

Message-ID: <01bdbab6$6157cc40$074d5da6@default>
Source record: 80892

Hi Guys --

I built a TT 1340 40 meter QRP transceiver. Everything works as it should, except the TX output is way low -- it draws about 300 mA on TX, should draw 800+.

I called TenTec, they thought the PA transistor was puny and sent a replacement. Didn't help. I've done all the usual & recommended stuff, like squeezing the toroid turns closer together.

Anyone solved a similar problem? Thanks in advance.

Hi,
I quess people dont build these things themselves anymore.
It takes time...

One idea for controlling the synthesiser is to use an analog pot.
If the pot is centered there is no frequency change, when you turn it left
the frequency goes down, when you turn it right the frequency goes up.
The more you turn, the faster the frequency changes.
Connect the pot to a A/D converter and let the microcontroller
figure out the how to program the dividers or DDS. Microcontrollers with
an integrated A/D are quite easy to find.

The synthesiser including the divider is my own design. The '96 handbook
has VERY MUCH BETTER chapter on frequency synthesis then your old '89.
It gave me a lot of ideas and information.
Also the mixer chapter is excellent.

Below is a block diagram of the synthesiser

```
VCO-->MIX-->TRACKING FILTER-->PROGRAMMABLE DIVIDER
! ! ! V
! VFO ! PHASE DETECTOR<--- REFERENCE DIVIDER---XTAL OSC
! ! !
!---------------!---LOOP FILTER<-------!
```

I hope the figure is readable.

Mike

My Friend:

There is wisdom in the code requirements. Dr. Frankenstein was an intelligent man on a noble mission. He lacked wisdom and created a monster. The code is a wall that keeps the barbarians out. It protects the civilized, from the lowest common denominator. Bypass the code and the good name of amateur radio will be lost forever.

Hello all,

I need a power amp for 13cm. There are a few modules available, they use either Mitsubishi MGF0905 or MGF0906 or the Thoshiba TPM2626-14 or TPM2626-20 devices. I've already had a look at http://www.rfparts.com, but they only offer Motorola devices.

I know from ohter devices that these are always half price stateside, and I would like to know if it is like that on these, too. Its not because I want to buy a single one, but several ones which are combined.

Please, if you have a list at your hands, can you please have a short look into it and tell me how much these are stateside?

Thanks a lot and cul!

>
>Mike
>

Richard didn't specify why he needed so much output at such a low noise figure. With many of the common GaAsFET's available, it's possible to get at least +10 dBm out, but not with such a low noise figure. I've used MGF1302's biased at 4 volts Vds at 70 mA to get 10 mW out up to 10 GHz, but the noise figure suffers compared to the recomended bias of 2.0 to 2.5 volts at 10 mA. The MGA86756 GaAs MMIC amp can supply +6 dBm output, +23 dB gain and a 1.6 dB NF for the simplest (and probably cheapest) device to use.

I personally worked very hard for my 13
wpm ticket, so that I could get onto
the low bands. Once there, I found the
quality of operator was just as
bad as up in VHF/UHF. 75 meters at some
times is a religious war, and
people wouldn't think twice about
stepping on top of you on 20 meters if
your
working DX.

Myself, I stay on 17 SSB and 440 mhz FM.

Don't say that the code prevents the
"barbarians" from coming to the promised
land of HF. I know of at least one ham
who is now an electrical engineer, who
cannot learn morse code to save his
life, but has to be one of the best
designers
I have ever met.

He stays on 6.

I'm sorry to join this flame war, but I
am not going to let people walk around
thinking that you are a more intelligent
ham if you have only 4 characters in
your
call. The reality of the matter is that
all that is required to get your
high speed code is a good sense of
rythem.

Just my two cents.

From: Tim Hynde <hynde@flash.neto>
Message-ID: <01bdbaa0$35c24620$3edac2d0@hynde>
Source record: 80903

I'm getting ready to purchase the DDS II VFO from S&S Engineering has anyone built one or have any comments on it.
I will be the used to run the W1FB Universal Superhet from the QRP Notebook.

Additionally, I had planned on using a 455KHz IF, and then building converters for each of the ham bands, is there any other IF that would work better? I'm uneducated when it comes to the problems associated with different IF's and potential birdys that may exist due to thier frequencys?

Ok, just one more. I've noticed many different VFO/mixer combo's out there as I am building my converters for each band should I stay with a simple scheme of a 5Mhz VFO or is there a good reason to change the VFO freq for particular bands?

Gracias mil,

Tim ka8ddz

I have been following some thread recently on building
QRP rigs and VFOs using digital synthesis chips. There
was much talk about the 175 MHz DDS/DAC chip called "AD9851".

Well, I have discovered a datasheet on the web:

AD9851 - CMOS 175 MHz DDS/DAC Synthesizer
http://products.analog.com/products/info.asp?product=AD9851

Note that even though I work for Analog Devices, this is not
a product in my work area and this is not a commercial plug.

771. Open Wire Feeders

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-07-29 00:00:00 UTC
From: Reg Edwards <g4fgq.regp@btinternet.com>
Message-ID: <01bdbb83$75d5d5e0$LocalHost@default>
Source record: 80911

"RJELINE1.exe" - OPEN-WIRE ANTENNA FEEDERS & ETC.

This small computer program will tell you almost everything you ever wanted to know about the operation and behaviour of balanced, open-wire transmission lines from power frequencies to UHF. The program's basic input data is the line's UHF impedance, conductor diameter and operating frequency, followed by resistance and reactance of the termination. Terminating impedance may be entered in terms of either the series or shunt values of R and jX.

Performance is computed for ANY complex load impedance between a short and open circuit. Input impedance is given in both series and shunt component forms. Values of VSWR, line loss in dB and reflection coefficient, and most important, the percentage of input power which is dissipated in the feeder, are computed. When a line is to be used as a transmitter tuned tank circuit or in a receiver front end, its resonant Q is computed. Exact mathematical transmission line formulae are used throughout.

The program can be used to design a transmission line for a given attenuation or power loss at a particular frequency. There is only one simplifying assumption - at HF the dielectric loss is negligible compared with conductor resistance loss. Conductor loss takes into account skin and proximity effects and is therefore accurate from 50 Hz up to UHF. The behaviour of open-wire phone lines and high power LF transmitter feeders can all be studied if you are so inclined.

Designing 1/4-wave matching transformers is a doddle. Conjugate matches between complex impedances can be achieved by using matching sections of lengths other than a quarterwave.

Not zipped-up. Downloads in a few seconds. Can be run immediately. Free.

>N7BUI

It is possible. I've done it with a tube tester that had a variable heater control. I would raise the heater voltage until it glowed noticably brighter for a minute or two but not enough to burn it out. It boils off the deposits and increases emissivity. Takes a little experimenting to get the right technique and worked about half the time.

Hi

I need a manual (or copy) for a Harris RF-3352 FSK Terminal. I will pay,
of course.

If not possible, then I need info on how to hookup the DB-25's.
Pinouts would be good. I can figure out the TTY loop connections and
operation of the unit by myself.

This looks like a nice unit and any help will be appreciated.

You can email me.

Thanks in advance.

Harry

Very true. However, it often tells you about his dedication. I listened to code practice every night I could, as well as worked as many people as I could at a slightly uncomfortable speed, for 6 months or so in order to get the Extra (this was in the days of FCC office testing and send/receive 1 solid minute of code). I didn't just get the 20 wpm in an overnight dream!

I should hope not. Either the barbarians on 14313 and 75 meters learned
CW and got legitimate licenses, or they cheated. The probability is that
SOME of them have legitimate licenses.

> was much talk about the 175 MHz DDS/DAC chip called "AD9851".

Did I miss this discussion ond r.a.h.?

I downloaded the datasheet some days ago.
1. It is a preliminary DS, lots of important information are still TBD, e.g. residual phase noise (with and without PLL). I would not use the chip yet.
2. Although beeing ingenious for frequency agile applications, where a SFDR of <60dB may be sufficient, I do not recommend using a DDS directly as the VFO because of the low SFDR.
For more information, read the articles of Ulrich l. Rohde about his DDS based PLL synthesizer.

As You wrote, however, a DDS like the AD9850 (for which a complete DS is available) may be perfectly suitable for a QRP tranceiver. It won't have the spectral purity of a VXO, of course, but it is certainly better than a 'low cost' (in this case also 'low quality') VFO using low Q varicaps. Additionally, if You use a very narrow band antenna (magnetic loop, Fuchs antenna) spurs may not be a problem anymore, because the antenna works like an extremely narrow input filter. Out of band signals therfore can't mix with the DDS spurs anymore.

Any other comments/experiences/etc?

Roland,

This is off the subject slightly but do you actually know were one can purchase a Motorola Micor preamp for $30? I am running three VHF Micor radios converted to repeaters. One has a preamp and I am looking for preamps for the other two. I have exhausted all the Motorola shops in my area and when I travel, I try to call to all the shops there. To date, no luck after two years.

I would appreciate it if you could steer me toward a dealer that actually have them.

Thanks

I'm building a general coverage, DC - 54 MHz SSB transceiver that will be using an old '486 motherboard as the controller. It's fast, cheap and easy to write code for.

I'm using a single conversion approach with a KVG crystal filter in the IF amp. (9 MHz) Lots of filtering, for the noise purposes noted here. The IF amp is the one from Wes Hayward's 'Progressive' or 'High Performance' receiver projects from the late 80's handbooks and QST's. The product detector is a modified version of Kampbell's R1.

I'm using a DDS card (PC-VFO) for the LO and am considering using another one in place of a 9.0015 / 8.9985 MHz crystal BFO setup. Talk about IF shift ...

The audio will be fed into the mic input of a DSP sound card. I've found some neat filters for the PSA type DSP cards, like auto notch and other goodies at tapr.org.

I'm using a homebrewed 8255 controller card for switching, key input and other control functions. I also have a rotary encoder I may add as an 'accessory.' The 8255 gives 24 lines for I/O, and is fairly easy to address. One of these can control all my relays, key input, t/r etc., and run an LCD display.

My ultimate goal is to have a neat little box that LOOKS like a radio, but is actually a computer inside. In bios you can tell most motherboards not to look for a monitor or keyboard -- the 8255 can handle those functions through your panel controls and the LCD. You can boot from a cheap hard drive, or find one of those EEPROM disk emulators. It's time ...

Any thoughts?

The muTek "front end" for the FT-290 is a very small add-on
preamplifier, with optimised gain. It is not a replacement front-end
like all the others, and the original muTek company didn't like it being
called by that name... but customers and dealers didn't care.

Back in the b&w TV days it was common to "shoot" the CRT to rejuvenate it. Most tube testers had the feature or the maker supplied a separate machine for the purpose. It never caught on for tubes, since these were relatively inexpensive and didn't warrant the trouble. Buy, yes, it will work if you get the voltage right.

John:

Seems to me there was an article in QST about a year? ago that used a
PIC mpu as a repeater controller.
Some years back, I used a 16C55 for a "controller" project, albiet not
repeater control. Fundamentally though, the code is about the same and
quite suitable to the bells and whistles we hear on the air today. I
haven't toyed with the newer PICS that use basic, but if I were to go at
it again I likely would. All of the PIC stuff is so well documented I
think you'd get just as far designing/constructing your own controller
as you would attempting to use somebody else's code.

Hi,
Great project.

How are going to isolate the 486 motherboard from the radio,
so that you don't get noise and carriers all over the place ?
Have experimented with how much the computer boards cause
disturbance ?

How big is the motherboard ?

I am looking for this much power to match a AD831 mixer in a repeater receiver. In Australia our repeaters operate in a hostile envronment RF wise due mainly to pager transmitters of about 1 KW EIRP on the 148-150 MHz band.(is this the case in USA?) Gain is not so critical but I am using helical filters with a loss of about 4 dB between them. If the front end has good headroom hopefully the intermod problem will be reduced. If anyone has a good solution...

Don't kow about J-Poles for other bands, but there is a good article about 2-meter J-Pole antennas in the January 1998 issue of CQ magazine -- essentially you short the end of a 4-1/2 foot (actually 4' 7-1/2") long piece of 300 ohm twinlead, feed it with RG-58 coax at 1-1/2" from the shorted end, and cut a 1/2" gap in the ground (braid) side of the twinlead at a point 18" from the feed point. I have tried this one, and it seems to work well, although I have not made any real measurements...

I concur with Roy and would add that small diameter coax is not essential.

Use 22 gauge twin speaker wire, or something similar. To ensure the choke is effective down to 1.8 MHz wind on nearly but not quite as many turns as the core will take. The loss in the balun may be less than when using coax because coax has a very thin inner conductor. (Which, for higher power levels, is also efficiently thermally insulated.)

I have been thinking of making a keyer with a PIC12C508 chip - an 8-pin DIP device. It would probably be a bare-bones keyer with no memory, no adjustable weighting, no speed meter and maybe a sidetone. I've been interested in a SMALL keyer with a minimum parts count for quite a while. This would probably just have a couple transistors and a pot and capacitor for speed control. It's just a concept now, and one of my "back burner" projects, but if I ever get it going and there is some interest in it, I may sell the programmed chips for a few dollars and probably even give away the assembly-langauge program/hex file for anyone with a PIC programmer.

Source record: 80814

Here's what I use. I take a ferrite core with about a 1" outside diameter, and wind 8-10 turns of RG-174 (0.1" OD 50 ohm coax) on it. One end of the coax is the balun input, and the other end of the coax is the balun output. You can use any kind of small 50 ohm coax you can find, and any size core you can fit the coax on. The ferrite should be a low-frequency, high-permeability type, such as Amidon/Fair-Rite type 43, or any of the 70 series types. I've used these at over 100 watts without any problem. For portable antennas, I make a dipole center insulator from a piece of PC board material, mount a BNC connector on it, and stick the balun on with some RTV.

836. Help! Identify vacuum tube working voltage

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-01 00:00:00 UTC
From: Luke <99310289@mail.wsu.edu>
Message-ID: <01bdbd11$069d2ea0$73037986@peng.physics>
Source record: 80816

Hi, I need help to identify the working voltage of a vacuum tube. Since the HAM people maybe one of the last group in the world still using vacuum tube, I hope somebody maybe can help me.

This tube is from an amplifier of my daughter's 20-years-old electric piano that is an antique model. It is mechanical type with a vacuum tube amplifier, not synthetic music keyboard. The power supply (transformer) out of function yesterday. The problem is, there is no any label shows the output voltage like the transformer in the market now. Since the transformer connects to the vacuum tube, if I can identify the wiring of this vacuum tube, then I can find the output of this transformer, that's the basic idea.

The brand of this tube is "Sylvania", model number "6CA4", there are 9 pins, I need to know, at least, what's the voltage that connect to pin 1, 4, 5, and 7?

Any suggestions? Thanks in advance!

Luke

>The brand of this tube is "Sylvania", model number "6CA4", there are 9
>pins, I need to know, at least, what's the voltage that connect to pin 1,
>4, 5, and 7?

4 and 5 are the heater: 6.3V ac/dc @ 1 amp
3 is the cathode
7 and 1 are the (separate) plates.

This is a full wave rectifier tube used to turn the transformer AC into DC for the piano's tubes. Typical supply plate to plate voltage is 500 to 700 VAC RMS. Typical max output voltage at the filter end is 250-350 VDC @ 150 ma

A replacement transformer will likely need to supply 6.3 volts for the heaters in your piano's tubes and probably approximately 600 VAC RMS centertapped. There are many old radios with transformers that would work if you could find a junk one. However getting it to fit is another story. Maybe it's time to get a new electronic keyboard. The new one's these days do fantastic things, including being hooked to a computer for playing and posting songs on the Internet, recording several tracks, different instruments ect.

I bought a new Yaesu VX-1R..tiny talkie. This is my 2nd unit.
I tried the mod for extended RX-TX and the mod doesn't work!

Mods on my original VX-1R worked fine.

Have there been any changes to the VX-1R to inhibit the mods from working??

thanks,

-C.T.

845. line side regulation of power supplies

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-02 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <35C3F32D.E2998C34@tri.net>
Source record: 80737

Am reviewing AA5C's excellent article in May 87 QST, A Line -Side Regulator for High-Voltage Power Supplies. Basically he uses a triac to turn off the supply in times of low load to keep the voltage from soaring. He achieves about 50 volt regulation throughout the load cycle. Apparently, since the triac is either on at load or off most of the time at no load there is little noise generation or inductive stuff put back on the line.

I know that some European regs require some protection from putting a high power factor on the line so this 12 year old article might be dated.

Comments, suggestions, etc?

I have a mil surplus 1800 V AC 1.7A monster transformer that I'm going to use in a doubling circuit with about 50 ohms in series with the diodes to lower output voltage to the 3500 volts I need. Load line looks ok, but voltage will soar markedly without load. This approach looks better to me than a variac, etc on the primary to make the transformer useful.

Thanks,

N0UU

>
> HSP45102PC-40 synthesiser

Without double-checking the exact number, I believe this is a Harris DDS. A digital control word precisely sets the output frequency as a ratio of the chip clock frequency.

> ICM7216DIPI counter

Off the top of my head again, I recall this is a frequency counter. Why is this part of a digital VFO built using a DDS? If the timebase for the frequency counter is the same as the DDS clock, the DDS is useless. Perhaps the counter is being used a (rather backwards) way to implement a frequency display? If so, it would be considerably better (and probably cheaper) to use a small PIC microcontroller.

> CA3338AE Buffer amp

This is more than a buffer amplifier, it is a high-speed DAC used to convert the digital output of the DDS to an analog (RF) signal.

Where was this project published?

I have an Icom 706 MkI and am trying to connect a headset to the radio. The headset is a Optimus Pro50-Mx, which has a dynamic element. The microphone that came with the radio has a electrete mic. I was wondering how I could interface this different type of mic to the radio. I am guessing that I would need to use a small preamp with the dynamic mic. If anybody has information that could help me, I would appreciate any help.

Thanks in Advance,

Matt C.

I seem to remember that it didn't work so well when other people tried the idea with other combinations of transformer and load - maybe because there wasn't enough real control over the phase of the switching point. The "bang-bang" on-off switching meant that the transformer core had to be re-magnetized every time, which puts a lot of electrical and mechanical stress on the transformer (as well as a lot of garbage out onto the line).

There was a similar idea in the European 'VHF Communications' magazine a few years ago, but with two important differences:
1. It didn't switch the transformer off completely, but used a series resistor (in the same place as a step-start resistor) to reduce the output voltage without completely de-magnetizing the core.
2. To short out the series resistor, it used a solid-state relay with built-in zero-voltage switching.

The idea was to measure the output voltage at full load, and then to adjust the series resistor to give about the same voltage off-load. The control loop then kept the output voltage constant between those limits.

Control was by a simple comparator feeding the solid-state relay. IIRC the time constant for the control loop was a fraction of a second, so it was a "burst" system, same as the AA5C design. Soft start was built-in, using a simple capacitor to slowly ramp up the comparator reference voltage.

I don't know how many people ever tried the idea (mostly because it was published in a magazine that the average PA experimenter wouldn't see) but is seems more promising than the earlier AA5C approach.

Earlier still, GW4FRX had published a true cycle-by-cycle phase control system for HV power supplies in 'Short Wave magazine'. That uses thyristors and it definitely does work, but it's much more elaborate.

>I know that some European regs require some protection from putting a
>high power factor on the line so this 12 year old article might be

>dated.

The power factor regulation has little or no effect on amateur-sized equipment. More relevant is the regulation against putting interference back down the line.

What comes back down the line from conventional PA power supplies is LF/HF garbage from switching transients caused by the rectifier diodes. The frequency distribution depends on exactly how all the power supply components "ring" together when hit by the transients. A conventional mains filter will usually bring it down to acceptable levels (and helps to protect the power supply itself as a bonus). Some US exporters are now making provision to fit mains filters for the European market, but I don't know if they do it for the home market too.

HB amateur equipment does not have to be tested here in Europe, but that is a politically negotiated privilege: we are not actually exempt from the regulations.

Good hints.

The actual objective is a five-watt balun for a 20m compact air traveler's dipole using RG-58 feedline. The center and end insulators would be bare epoxy PCB stock.

Brian, if you have some RG-174 then by all means use it. If Roy says it will work then it will work. I mentioned the thin speaker wire, or even a pair of seperately insulated thin wires, because there's always something like that in everybody's junk box. For 5 watts on 14 Mhz its very likely an even more compact 3/4" diameter ferrite ring would do. But mechanical fragility eventually sets a limit to QRP miniaturisation.

Have you tried one of the web search engines? It seems a bit
ridiculous, but I pulled some Plessey prescalers off a surplus board.
Well, I was fairly certain they were prescalers. I checked the Plessey
site, no sign of it. I went to a search engine, I think Yahoo, and
entered the part number. It turned up some page somewhere for a Motorola
device that was the same (and no sign of the IC on a Plessey page). I
hadn't expected to find the information that way, but sometimes you never
know what will happen.

The number doesn't sound familiar, but then I've not kept track of recent
devices. It was just the IC? I traced out the circuit around the IC on
the board I got, and at least was able to get the pinout that way. That
doesn't work if it's just the IC.

Try 300 ohm twin lead for the dipole and a quater wave of 4 wire roter cable (it is 300 ohm size but 4 wires.)�� Use some cable tties for the end insulators.� The 4 wire cable has it's center two wires srorted at th dipole, and the outer two connected as if they
were 300 ohm cable.� At the transmitter end the wires are shorted by alternate pairs, i.e. 1 & 3 connect to the coax center, and 2 & 4 connect to coax ground.� This ballon will provide a perfact 4 : 1 ratio, the 300 ohm dipole at one end and 75 ohm cable at the other.� It will cover the entire 20 meter band.� The 75 ohm mismatch to the 50 ohm transmitter will not be a problem.�

From: spider3 <spider3@flash.net>
Message-ID: <6q5cu0$fe5$1@excalibur.flash.net>
Source record: 80674

the only people i read that are complaining about this stuff are the old guys who r mostly extra class, they think that if the 20wpm test is eliminated the all other hams are going to get their A class ticket and over power them. not true. some time ago they propably started as a novice and the old "farts" at the time were complaining that if the novice are just loosers just like CBers, and its all easy getting your first lisence no its not. i mean why the hell would you waste your time studiing when you can do something else that you want its hard but everyone had to take the first step and try. those old "geezers" also thought that there should not be a no code lisence. now the newer old guys are complaining about this change. if you think that there should be no no code lisence or a general with a 5wpm test why the hell not just have one class, extra? because you cant take the tests all at once thats why, and while your studiing to upgrade you have a lisence to operate, but with less privilages. more lisence classes makes it easier to get your extra class lisence, duhh!!!!!!!! this proposal gets the hobby going so that newcomers can get in and get interested in the hobby and to get it going!!!!!!! SO STOP COMPLAINING YOU WERE ONCE NEW TO THE HOBBY TO!!!!!!!!!!!!!!!!

867. FS: 5kw roller inductor

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-03 00:00:00 UTC

I have a brand new strap type roller inductor. It is 21 uh and will easily take 5kw. It is out of a military tuner but is new. End bearings are mounted through Teflon.
It measures about 5"x5"x8"deep. Would be great for a tuner or an amplifier. This truely is a very nice roller if you need one.

price $90 shipped to your door.

All you did was post a complaint without any details of what actually transpired. Please include information on what you have done in attempt to get the radio, before badmouthing someone on Internet.

Did you actually talk to him on the phone about this? If so, what did he say? If not, why not?

Maybe he had to leave town on business for a couple weeks? Maybe he had a family emergency? Maybe he shipped it and UPS lost it? (Happened to me once; fortunately, the item was insured.)

In the last year I have purchased 6 or 7 items that were advertised for sale on Internet, some rather expensive. I haven't had a bad experience yet. One person even TOLD me he wasn't going to be able to ship the item for about a month, as he was going to be out of town on business. I agreed to that. It arrived right on schedule.

So I'd ask you to either post full details of your efforts, or be a little more patient.

73, Zack W9SZ

The handbook is certainly a worthy refernce (I have mine on CD-ROM). There are a number of good introductory books and study guides for those starting off. Check out http://marconi.mpce.mq.edu.au/wia/bookshop.html for a list of titles available from the Wireless Institute of Australia (NSW).

Good luck with geting your licence!

875. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-03 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6q337n$b4k@news.Hawaii.Edu>
Source record: 80759
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

876. Brand New karate Website

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-03 00:00:00 UTC
From: uechi@ici.NET
Message-ID: <3.0.1.32.19980802204500.00b822f0@pop.ici.net>
Source record: 80760

Dear Martial Arts Enthusiast

I entirely rebuilt my website and just moved it to a new location at http://www.uechi-ryu.org.

First, this is NOT SPAM nor am I advertising a product to sell by this letter. I wish to share good karate techniques, some which took me 30 years to learn.

If I have sent you this email by mistake, type REMOVE in the subject line of your emailer.and I will promptly remove your mane from the mailing list.

Although primarily a Uechi-ryu website, I have substantial experience in a number of other martial arts, specifically the Korean arts, and I write my weekly classes to be beneficial across all fighting systems. I also provide a dojo list and a website link list, which continues to grow. My website also contains other features which may benefit you, so please visit and the first time you do so, send asome email to voice your opinion about my site. Please visit often and read my weekly classes and enjoy.

I would appreciate one initial RSVP of this letter. If you have a martial arts website and would like to exchange links, let me know.
Yours in the martial arts,
-- Allen

P.S. If you have received more than one of these, it is most likely that my mailbox has you listed under more than one email address. Type DUPLICATE to all the ones you wish to have removed. I am taking every precaution to send this only to those I think will be interested in the martial arts and studying from my website.

I want to learn how to tune two way radio's!

"Don't laugh........"

I have a very basic knowledge of electronics and am looking for a book that
will teach me how to it!

"You still laughing?"

In the book will be what equipment is needed, how you do it etc.....

can anyone recommend a good book? I'd appreciated it.

Thanks Phil.......

P.s Wouldn't mine getting my ham licence.....

What's it called...the ARRL Handbook, or something like that? Here in
Canada, it's available at the local library. Hope this helps.

Hi Everyone,

>>Get his employer on the phone, let him know he may have a thief working
>>for him!

A good idea, perhaps, but possibly illegal! When I was in the Marines I had a creditor that said I owed an additional payment when it had indeed been sent and receipt received.

They threatened to call my Commanding Officer and tell them I was a "dead beat".

The Marine Corps sent a letter to them that first of all the debt was my problem, not theirs, and secondly, Fair Credit Practices Act's prohibited such communications unless a garnishment order had been issued by a court.

I think Zack made some excellant points and should be considered. If he doesn't respond shortly thereafter, I'd notify the Postmaster General that I was a victim of fraud and to prosecute. Failure to ship the radio may be a federal offense.

73 and sorry to hear about the trouble.

Steve

Hi Spider and Net,

Have patience, friend, for this too shall pass.

Read "200 Meters and Down". It was a "history of amateur radio up through sometime in the mid thirties. The Navy tried to completely stop Amateur Radio after WW1 and we survived that.

Then there was a move afoot to at least minimize it after WW2, but there was an even bigger uproar over that, especially since something like 2/3 or more of all ham radio operators enlisted or were in some sort of war related service.

Then there was the flap over incentive licensing in the sixties, and the no-code license in the 90's.

For Amateur Radio to remain viable, it must change with the times. It has before and it will again. And it will survive this too.

Personally, I like the proposals. I always thought the class name "Extra" was inappropriate anyway. And "No-Code" Tech has a very negative connotation to it. This change amy not solve ALL the problems, but at least it will help stem the tide!

What people NEED to be concentrating on is supporting bills like the one in Congress now to force the FCC to reallocate bands to Amateurs anytime they take one away.

I am a 26 year plus ham, and I'm not complaining! I think it's about time!

Hi Wayne -

Mine worked right off the bat. Thinking about yours - are you running it into a 50 Ohm load? The final stage is undoubtedly the main current drain and, if it doesn't have a sufficient load, it won't draw as much current. Similarly, if you worked into a lower impedance the current drain would increase (limited, in the case of a short, by the transistor's built-in ballasting resistors).

If you know your load is OK, check the RF levels out of your TX mixer, and each stage from there on out with a good wideband low capacitance 'scope and probe. I can do the same here (or TenTec probably has the numbers) which will tell you where the signal is failing to be amplified - thus the source of the problem.

Best of luck!

Jim Horn WB9SYN/6 (Studying to upgrade from Tech+ so I can use it)

HPS that goes intermittent could be caused by eye or lamp (both of which you changed) or the ballast.

After an HPS fixture cycles for awhile, the ballasts is slightly damaged, and the next lamp won't last quite as long as the first one did. Not that there is anything wrong with the next lamp; the lamp is fine and would work in a new fixture. If the cycling is allowed to happen again (at the end of the second lamps life) then the ballasts is bamaged a little more, and so on. The trouble with hps is after awhile the ballast is no longer able to deliver the voltage necessary to keep the lamp lit. Just look at the operating parallelogram of a ballast in any fixture spec catalog or in the IES Handbook to see what I mean.

To check for a bad starter in and HPS fixture, try a mercury vaopr lamp of the same wattage in the fixture. If it lights and seems to run ok, the ballast is probably ok and the starter is bad.

For many people yes, though here in Australia the tests are easier than in the UK (assuming you guys still have 12wpm random character tests). Here you have a choice of 5 or 10 words per minute of plain text. Five is easy with a couple of weeks practice on a PC; 10 takes a bit more work... :-)

Perhaps you don't understand that I've been licensed for 35 years.
And you certainly don't understand that 30m is my favorite HF band.
You might correctly surmise that I only operate machine digital modes
there, however. I have no problem with sharing that band with the few
Morse operators who seem to hang out there. I only expect them to
extend the same courtsey to my operations (which are very much
QRP).

If an air conditioner thermostat is picking up RFI, causing the therrmostat to turn off the a/c, is it possible to install bypass capacitors or some kind of filter to fix it?? The thermostat involved is one of those with the timer to change the temp setting for different times of the day/week. It would be difficult to shield all the wires running from the thermostat to the rest of the unit, so some sort of filtering seems called for. Any ideas??
Jack

==========
Do you mean Double Side band (DSB) suppressed carrier or DSB full
carrier . The latter is somewhat simpler.
What do you mean by " to save max amount of space "??

Nowadays both sending and receiving is in 'QSO'
format...supposed to be more realistic than PL
and figure-groups.

I've never heard of a special band segment for DSBsc, though I've not kept
track of six meters lately. In the early sixties, when SSB was first
making inroads on VHF, there were articles about DSBsc rigs and adapters
(I recall one that was fed from a Sixer). They'd usually say something
about how DSB was far simpler than SSB, but almost as good in terms of
"talk power". Most of the articles would say how the person on the other
end would in most cases not even notice the extra sideband.

Someone else might be better able to answer the question, but my
guess is that it would be okay. I suppose it might be different if
there were loads and loads of stations using DSB.

If you're going to use a non-phasing direct conversion receiver,
remember that you will have problems tuning in another DSBsc rig.
Not likely to happen, but it the idea takes off...

Years ago, it was common to see high-level DSB modulators. In
other words, you'd have the final amplifier arranged as the modulator.
I think more efficient(?), and you wouldn't have to worry about
a string of linear amplifier stages. In recent years, I don't recall
seeing that sort of thing, and the few times I've seen mention of
DSBsc, they use a low-level balanced modulator, and follow it with
a string of amplifier stages.

You might want to consider the former, if you haven't already.

Jan-Martin Hertzsch <jmh@disr01.mpae.gwdg.de> wrote:

>Is it also compatible with AM?
>

The short answer is no.

However, if you unbalance the carrier of a DSB transmitter (by adjusting the variable potentiometer in the balanced modulator) you will be transmitting AM. You will then be able to hear the transmission on an AM receiver.

The other option is to add a BFO to the AM receiver. Because of the bandwidth of the AM receiver (which allows you to hear both upper and lower sideband), tuning will be very critical, and signal clarity won't be as good as with a normal SSB receiver with a proper crystal or mechanical filter.

It is possible to receive AM signals on a direct conversion receiver, though the AM carrier will beat with the local osc signal and you will need to une carefully.

Hello!
I would like to design a GaAs-FET preamp for the E5 VHF television channel
(about 175 Mhz) with 75 ohm input/output. Where do I find a cookbook or
anything similar?

There are commercial single channel GaAs-FET preamps for the
Danish UHF-transmitter frequencies being sold here, but none for VHF.
Therefore I have to design it myself!

Thank you in advance,

SM5LWC, Gert

NEC used to have some quite useful applications booklets on this.
They were produced by NEC's California Eastern Laboratories
& may still be available from NEC or their distributors for their
RF discrete devices.
It's also worth looking at Websites for NEC,Mitsubishi etc.
as many manufacturers put downloadable applications
notes on their websites.

I tried to find on few years ago, Ampenol quit making them .. Solved it
by replacing the panel part with a Radio Shack 4 pin mic connector.
It fits nicely, is not too hard to rewire .. bonus.. my kenwood mic now works on the
heathkit and the kenwood.

I wouldn't be able to recognize number 38 wire, but it must be quite thin.
A couple of sources of quite thin wire come to mind if you only need
small quantities. In some of the tv sets I've found in the garbage
there have been long thin tubes with a covering over a long coil of
thin wire. I assume it's a delay line. The voice coil of speakers
might also supply thin wire. Or relays or small transformers. It
all depens on how exact you need the size, and if you can get by
with lengths that are smaller than the amount you unwind.

The deflection yokes on tv sets are a good source of enameled
higher guage wire, I'd say something like number 18 or 20.

==========
May I suggest we express ourselves 'more completely'

If we talk about SSB we mean single side band amplitude modulation
and suppressed carrier

If we talk DSB it can be either double sideband amplitude modulation
,suppressed carrier
or double sideband amplitude modulation with full carrier also
referred to as AM .

DESIGN WORKS LITE v3.3.0 for WIN by Capilano Computing is a fully-functional electronic schematic
drawing program for use by professionals and students. It features complete component libraries
for analog, digital, component and 74xx IC's and you can create your own thru its DevEditor. This
program will export files to other PC board router packages, and is COMPLETE for file editing, saving
and printing -unlike other crippled products. This software is FREE (regular $495 retail) as it does
NOT include the HELP files or tech notes. A 2.6MB download in ZIP format w/SETUP WIZ for WIN9x.
After install, the program expands to about 7MB. Here are some features described on their site:

o Draw, save, edit and print complete, professional circuit diagrams using powerful features like bussing,
multi-level Undo/Redo, and automatic gate packaging.

o Use the library of common 74XX and discrete symbols provided or create your own libraries using the
built-in symbol editor.

o Send compact circuit diagram files to friends or colleagues over the 'net. They can get their own free
copy of DesignWorks Lite to view, edit and print the circuits.

For Capilano's homepage, info and download:
http://www.capilano.com

For ALTERNATE download from ZDNET:
http://hotfiles.zdnet.com/cgi-bin/texis/swlib/hotfiles/info.html?fcode=000PEM

Note: I am NOT connected with ANY firms discussed here. Just a ham homebrewer that downloaded
and installed this software based on a note I read in the QRP-List. Its a nice program, and the FULL
version ranks up alongside OrCAD. Cheers, and 73...

Steve,

If your circuit is an anti-resonant (parallel) mode oscillator, you
need to specify a load capacitance to the crystal vendor and they will
take it into account.

If the circuit is a series mode oscillator, then you specify as much
and they will accomodate that as well.

If you don't know, email me a description and I can probably tell you
which you have.

DSB is fully compatible with SSB. You should build your rig to operate
on the most populated SSB part of the band.

Most people listening to you on SSB receivers will not know that you are
using DSB unless they switch sidebands.

The links section of my QRP page (URL below) contains two or three links
to Japanese pages that have constructional info on small 6m DSB and SSB
transmitters/transceivers.

Hmmm, well, I must confess, I was thinking about the CW test for an Irish amateur licence (or more correctly, radio experimenter's licence), and I was assuming it was the same as the UK test.

I bet you guys never had to wait over a year for amateur test results (as I had to in 1982-1983, before I got EI6BTB)...

Does anyone know a part number (or source) for the microphone connector used by heathkit? I think they used this 2 pin connector on alot of stuff. In this case, I need it for a SB-102.

Thanks,
bruce n9bh@svs.com

As someone else pointed out <http://www.microchip.com> will have all
the device info you need. The 16C84 has more or less been replaced
by the 16F84 and I would recommend you use that instead if possible.
If you want to program 16x84 devices with minimal hardware you might
have a look at <http://www.man.ac.uk/~mbhstdj/icp84.html> or my
PIC links page <http://www.man.ac.uk/~mbhstdj/piclinks.html>.

All;

I've picked up a Heathkit IT-12 Signal Tracer for a nice price, and as it needs some work I'm wondering if anyone has or knows where I can get a schematic and/or manual. I'd like to add this thing to my test bench, especially as the cabinet is in VG condition, and a working signal tracer would be rather useful.

Thanks,

Tom WA8PYR

Ian's suggestion may be a good one. Bang-bang regulation in the primary
can be a problem if the inductance of the transformer and the resistance
of the load aren't carefully controlled. I tried building a high current primary
switched regulator some years ago and found that I had to use very heavy
bleeder loading to maintain stability, and to make the triacs survive. You're
pulsing a LCR network, and ringing in that network can kill your triacs. This
is the typical problem with any simple switching design that has to regulate
from no load to a heavy load.

It seems to me that putting resistive keep alive in the primary may be a good idea. As Ian notes, it maintains magnetization of the transformer and so reduces the inductance swing of the transformer as choke. It should also provide some transient dampening in the switching circuit. I still suspect you'll wind up having to use rather heavy bleeder resistors across the supply output in order to maintain regulation at no load. And for sure you'll need more capacitance in the output filter than you would for a conventional design.

>Anybody got some reliable schematics and component values for an ELF
>receiver..?
>Be interested to communicate further.
>Dave.

ELF receivers are generally just very sensitive audio amplifiers with a mains frequency notch filter in the front end (essential). If you need more selectivity, a gang tuned preselector can be added. But more typically today, software doing a FFT using your computer sound card is used for added selectivity. Antennas are usually of the voltage probe design and contain an active FET follower circuit for impedance transformation.

Superhet designs are rarely used for ELF receivers, but an up conversion design converter to a communications receiver is often used at VLF and could be extended to ELF with some difficulty.

There was a design printed in Communications Quarterly some time back, and the Longwave Club of America website has links to what they call "natural radio" which outlines receivers you can build to hear the natural radio noises produced by lightning (whistlers), solar wind reacting against the ionosphere (dawn chorus), etc. TenTec even offers a sensitive AF amp, with added components for use as an ELF receiver, as a kit.

(Note, a magnetic phono preamp can be pressed into service as an ELF receiver. Add a mains AC notch filter and a FET follower voltage probe antenna.)

It should be obvious that running any ELF receiver off of mains power is going to be a problem. Battery operation is highly recomended. Best reception will occur when you're located far from the mains power distribution grid. Many ELF listeners operate portable in national parks or other rural areas where they are distant from the AC power grid.

It is likely that installing 0.001 uf disc capacitors across the various
leads to the thermostat will cure the problem. You *may* have to
add series RF chokes as well (brute force filter).

Have about 50 used 6 and 7AH 12 VDC gel cells for sale. All load
tested good. PERFECT for QRP rigs
and portable operation. I have sold hundreds of these to the QRP boy's
on the QRP mailing list and all have been very satisfied. Had a few
damaged in shipping and one came back DOA which I replaced for the
fellow free of charge but that's it. I am the service manager for an
alarm company and we change our customers batteries every 3 years as
preventive maintenance. These used cells should provide another 2 to 3
and probably longer service if used and recharged properly. Cells come
fully charged and are ready to go. They can be recharged with a simple
wall wart charger available at Radio Shack or a 1 amp automotive
charger. I guarantee against DOA.
Brands are Yuasa, Interstate, Radionics and Portalac.

4 ah cells are $8 shipped CONUS (SOLD OUT)
6ah cells are $10 shipped CONUS
7ah cells are $12 shipped CONUS

Images of the cells can be seen at:

The problem with salvaged magnet wire is that if the original assembly was varnished or sealed, you risk ripping the very thin insulation off of the wire in spots which can lead to all sorts of problems with shorted turns later on.

However, I agree that it is sometimes possible to get wire - hundreds of feet or more - from small reed or normal relays, solenoids, and in the old days, focus coils for CRTs (but they don't use these anymore). Deflection yokes may be iffy for the reasons cited above.

I wouldn't be able to recognize number 38 wire, but it must be quite thin.
A couple of sources of quite thin wire come to mind if you only need small quantities. In some of the tv sets I've found in the garbage there have been long thin tubes with a covering over a long coil of thin wire. I assume it's a delay line. The voice coil of speakers might also supply thin wire. Or relays or small transformers. It all depens on how exact you need the size, and if you can get by with lengths that are smaller than the amount you unwind.

The deflection yokes on tv sets are a good source of enameled higher guage wire, I'd say something like number 18 or 20.

Hi,

I need an RF sensed T/R switch for bypassing during transmit,
a 440 resonantor I built. First choice is design using relay.
Can someone suggest suitable relays for this type circuit,
Two I have tried, not for RF, failed with large capacity.

Need source such as DigiKey, Mouser, and part numbers.

If a circuit and layout was available, that would be nice also.

Must be able to switch 20 watt RF source.

Thanks for any help.

Also apparently used in the HW-101 and HW-202 and perhaps more. I suspect that you don't want the Heathkit numbers so, not to keep you in suspense, in a 2-3 year old Allied catalog, the connectors are now made by Wire Pro, Inc. instead of Amphenol:

Allied # Mfr.'s # Description
cost
719-3105 80-MC2M Male Plug $6.92
719-3110 80-PC2F Female Receptacle $5.16

Allied's Service # 1-800-433-5700 or htttp://www.allied.avnet.com

As I stated, this data is a bit old, so check for more current info. Of course, you might want to just go and switch the connectors to something more convenient, especially considering that the returns for the microphone and PTT are soldered to the spring strain relief, which then is mechanically connected to the microphone shell, to make the third terminal in the circuit.

I found the original reference, which was 'VHF Communications', issue
4/1988. The articel does mention and critique the AA5C circuit, and ISTR
there may have been a follow-up note in QST about loud noises coming
from the transformer.

>It seems to me that putting resistive keep alive in the primary may be a good
>idea. As Ian notes, it maintains magnetization of the transformer and so

>design.

I dug out the VHF Comms circuit and will try to describe it.

The HV (around 3kV) is divided down to about 5V by a string of five 4.7M
resistors, and then 56K to ground (paralleled by 0.1uF). This 5V feeds
the inverting (-) input of an LM393 comparator via a 10K resistor.
The (+) input of the comparator is connected to a stable adjustable
reference voltage of 3-10V.

The reference voltage comes from a 10V zener diode. A 470 ohm resistor
drops the voltage from the +15V (unstabilized) rail, and the diode is
paralleled by 200uF. This makes the reference voltage ramp up slowly at
switch-on, so the whole power supply gets a soft start.

The output of the 393 comparator has a 4.7K pull-up to the +15V rail,
and there is also a 2.2M positive feedback resistor from the output to
the (+) input. This feedback prevents the comparator from dithering
about the threshold voltage, and it means that the HV can vary within a
50V band before the comparator changes state. Also connected to the ouut
of the 393 is an emitter follower that drives the solid-state relay and
an LED indicator.

When the comparator output is high, the LED lights and the solid-state
relay shorts out the keep-alive resistor in the mains primary. The value
of that resistor is adjusted until the off-load voltage is just below
the voltage required for full load. Therefore the LED never lights when
the PA is switched to standby, and it stays full-on at maximum load
(because the keep-alive resistor is always shorted). At intermediate
loads, the authors say that the LED "blinks" as the HV varies within the
50V band.

They said that the circuit had been added to a Drake L7, which
originally had an off-load voltage of 3600V and a full-load voltage of
2900V. With the regulator circuit, the off-load voltage only rises to
3000V and the on-load voltage is still 2900V. Dissipation in the

resistor is about 50W.

That's all I know about the circuit, but I hope the description gives enough information for anybody to be able to sketch it out and try it.

CONAR Tube Tester, Model 223, with assembly and use manual.

Appears to me to be a tester part of a National Radio Institute course. Seems to be well made/soldered.

Suitcase it is in is wood it seems covered with leatherette. Very good conditiion with a few scrapes but no tears or breaks. Handle metal hardware is rusty but the handle is fine and the latch for the case is rust free.

The inside looks very good. Shiny panel, near new looking knobs, slight blemish /scrape on meter plastic cover which doesn't affect the use and is not bothersome.

Original ILLUMINATED roll chart is dated 1971 and moves freely. Update manuals with dates of 1974 and 1978 are almost like new. Has Compactron socket.

Seems to work fine. I tested a 8FQ7 which I pulled out of my tube box at random and it's an easy and quick tester to use.

It will be 15-20 pounds to ship after I box it well.

$35 plus shipping from San Jose, CA area, ZIP 95070.

Will ship UPS COD if you pay the $5 COD fee. Otherwise $35 + allowance for shipping 20 pounds in a postal money order. I will refund any unused shipping.

Ian, K6SDE
San Jose, CA area

971. Computer-controlled VHF tuner?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-06 00:00:00 UTC
From: Don Corbitt <donc@analogia.com>
Message-ID: <6qdetf$mfc@q.seanet.com>
Source record: 80615

[Slightly off topic.]

I'm interested in putting advanced avionics in an experimental airplane (in other words, fewer FAA restrictions on modifications). One of the items would benefit from using one or more digitally controlled aviation band tranceivers.

Does anyone here know of sources to any of the following:

A) Aviation band black box tranceiver - all functions controlled by computer (rs-232, etc), no keypad or readout display?

B) Kit that would allow creation of item (A) above?

Currently no FCC license is required to use the radio in a small plane. (I don't think we even need FCC approval to install the radio.) Would the FCC care if I installed a homebrew radio in my plane?

Thanks for your help. Email would be great, although I'll try to check for messages here as well.

If anyone wants to join our discussions, subscribe to the avionics mailing list in my .sig.

8/6

For Sale: Fisher and Dynaco

Dynaco ST-70/ PAS-3/ FM-3

ST-70

Fully Rebuilt to stock specifications with new resistors, new film caps, new internal wireing, gold RCA jacks, binding posts and AC cord. Originally a factory wired unit. Some rust on the transformers. Shiny chrome. Brown cage. Strong quad of EL-34, Dynaco branded 7199 and Mullard 5ar4. Includes copy of manual and my personal notes file (100+ pgs).

Works and Sounds great! This is truly a "plug and play" unit!

$375.00 + shipping

PAS-3

This is an original factory wired unit in very good condition. It is stock.
In good working condtion and sounds wonderfull.
Includes copy of manual and copy of my personal notes file.

$160.00 + shipping

FM-3

This is a good original and stock unit. Strong eye tube.
Wonderfull sound- makes FM enjoyable!
Includes copy of manual and copy of my personal notes file.

$140.00 + shipping

I will sell as a trio for $625.00 + shipping

Fisher X-100 integrated amp

This unit is in good working condition. NOS powertransformer from the Fisher Doc.
New coupling caps. Just back from tech check up. Includes all tubes.
Brass face is overall clean with some corrosion around knobs. Some of the knobs are MIA
No case

$150.00 + shipping

Please reply to: rl1856@ix.netcom.com

That's the best way to go, IMHO. With a little effort, you can control your whole receiver from the LPT1 port, which also makes it easy to use an outboard PC if you desire. Considering you can buy a 486 motherboard with CPU, RAM, and I/O these days for not much more than a BASIC stamp, it's hard to imagine going any other route.

The PC-VFO is a nice quick-and-dirty signal source for bench testing, but have you ever looked at its output on a spectrum analyzer? It's quite revolting. You can do about 30-40 dB better with a Qualcomm DDS and separate DAC. If you stick with the PC-VFO, you should plan on cleaning it up with a PLL with a very low loop bandwidth, or else your receiver will be plagued with lots of spurious responses.

IMHO the best thing to do is to shield the receiver RF circuitry fanatically well (e.g., build everything in RF-tight subassemblies connected with heavily-shielded coax). That way you don't have to worry about the PC motherboard at all. It can be mounted anywhere that's convenient inside the enclosure. (A good, RF-tight enclosure for the entire receiver will render the digital electronics as quiet as an average home PC, if not more so.)

First let me say 73's to everyone.
I just picked up a used Kenwood TM-241A, There is a problem in the MC44DM microphone I think? The radio will transmits but with no audio. Anyone with this problem please respond with your info. A wire diagram for the microphone, the radio and any mods you may know of for this radio would be useful also.
Thanks to all, n3ysy@qsl.net .

>anything similar?
>

I personally use the software named Puff to design GaAs-FET preamp in
the 0.1-8 Ghz range, usually without lumped components.

You can try to adapt a 144 Mhz design from the ARRL handbook.

Another option is to use a 50/75 ohms gamma opt bipolar silicon such as
AT 42085 wich give a noise figure of 1.1 dB at VHF without any need to
match the input and the output in a 50/75 systems, just like MMIC but
with a better noise figure.

Kits!? We don't need no stinking kits!

Seriously, for at least ten years I have had almost monthly orders to Digi-Key, Mouser, etc. for parts. Right now I have incomplete: 220 MHz transverter, 144 and 432 MHz high-power amps, DDS VFO, microwave PLL design, 40-meter QRP transceiver, and probably a few others that have been buried by the above projects and forgotten.

Most of these will be done in a few weeks or a few months and by then I will be eyeing a dozen other projects to build. Homebrewing is not dead in this neck of the woods.

==========
May I suggest we express ourselves 'more completely'

If we talk about SSB we mean single side band amplitude modulation
and suppressed carrier

If we talk DSB it can be either double sideband amplitude modulation
,suppressed carrier
or double sideband amplitude modulation with full carrier also
referred to as AM .

Perhaps we should use the supposedly international abbreviations
like A3E for AM voice and J3E for SSB voice. But what would be
DSB voice communication in these terms?

No kits! There's plenty of kits available. I've built kits and from scratch. There's plenty of home brew articles around. I've also trouble shot and repaired my Icom 761 a couple of times including replacing the vco capacitors. I've modified the 761 filter selection circuitry as well. You'll never convince me there's no longer a need for theory - the need is greater than ever. The biggest need is to teach people how to set gain controls so they don't splatter all over the band.

Good for you! Try as may I could never figure that technical stuff out, but I can receive cw at 35wmp on a good field day. Give me cw/QRP/p anyday on 30m and just call me when it's time to eat. One of these days I'll do a tuna-tin for 40, but first I gotta get the ole dipole up and that requires climbin' and solderin', and frankly I remember what it was lke when the antenna had enough and came down. I too,had enough. Is it worth getting sparky fired up again?

standard closing,

Out of curiosity, I looked up DSB in the U.S. FCC regulations (Part 2). It looks like suppressed-carrier DSB would be A3E, like A.M. They show "A" as meaning "double sideband", with no mention of the carrier level. In contrast, there are three categories of single channel SSB telephony, depending on the carrier level: H3E (full carrier), R3E (reduced or variable level carrier), and J3E (suppressed carrier). So it looks like DSB would be A3E regardless of the carrier level.

Regarding the original topic, a person using a modern SSB receiver to receive a DSB signal will hear only half of it, so half the transmitted power is wasted (worse yet, causing QRM). If the rig were SSB instead of DSB, the battery could be smaller for the same useful signal, maybe making up for the increased size and weight of the components needed to make the rig SSB. (The battery wouldn't be half as small, though, because the receiver drain is frequently a major player in battery life.) DSB can, I believe, actually be more effective than SSB (at the expense of twice the bandwidth), but only if the receiver is designed to extract the information in both sidebands. Modern SSB receivers are not.

If you reduced the power in the unwanted sideband by only 10 or 20 dB, it would just about double your talk power for the same battery power consumption. This level of suppression could be achieved with a very simple phasing network.

Roy Lewallen, W7EL

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Parallex makes a "small computer" called the Basic Stamp. The unit
is designed for simple control operations, where a short Basic program
can control or do something.

I'm thinking of using the Basic Stamp I (Rev. D) to provide CW ID every
10 minutes with my ATV transmitter (the module was made by PC Electronics).
In my case, my ATV transmitter is in a remote controled car and feeds a
video signal to my TV. The transmitter is putting out only 80mW of
power; not a lot, but just enought to reach my TV.

Has anyone used a Basic Stamp with any RF equipment?

Does the Stamp put out RF noise that would interfere with the ATV signal?
(Assume I put the Stamp in the same metal box as my ATV transmitter.)

OR . . . Is the Stamp sensetive to RF signals?

i am getting skunked, trying to set up a tvro, in spite of some very useful advice from some nice folks in the tvro ng. i _know_ this is not beyond me.

but no amount of diddling with the dish aiming is going to help. so that leaves me wondering about my next step (which will be checking voltages to the lnb's). the system worked fine before i moved it (i have an electronics & computer hardware background, repair included).

but what i would really like to do is use a Tek scope to check the output of the lnb's (c-band, ku band) since the ird signal strength meter seems to be giving bogus readings.

is this practical? can i construct a "simple" divider from commonly avail parts to bring "L band" down to 100mhz. has anyone tried this? am i "way over the top" in suggesting this?

is there something i can use as a "source", that would give me a "target" to test with??? some kind of amateur kit/project for a low-power xmitter. does Radio Shack have anything that could be used/adapted? i used to have a suplus radar test station, the waveguide looked about the same size as c-band, but of course that is _long_ gone, now ;-).

any suggestions (or speculation) welcome.

thanks,

loren

i am laughing at myself tonight. i did take pains to mark the cables
(ku/cband), even using a jumper and meter (thinking this is overkill, i
can always just swap them) since this was my first time with tvro.

well, i screwed that little step up! and for three days i have been
thinking to myself, "well, maybe it _was_ wise to go slow on this...".

A-A-A-R-R-R-R-G-G-G-G-G-G-H-H-H-H-H-H!!!!!!!!!!

well, anyway, i am at least on 1st base tonight, thanks in no small
part to the folks at tvro, that were so generous with their time.

thanks to all,

loren

These two systems will result in the same SNR (signal to noise ratio) at the output of the preamp. In your case 1) the preamp is noisier than in case 2) but you are overcoming the extra 2dB of noise by providing 2dB more signal (8dB antenna gain vs 6dB). So, you end up with the same signal to noise ratio.

This depends on where the dominant noise is generated. If the dominate noise is external like 40 meters on Friday night, the two should be equivalent. At vhf and uhf frequencies, the dominant noise is the front-end noise of the receiver. If this is the case, go with the amp with the best noise figure.

Sorry Old Man, but you have the wrong newsgroup -- this is for radio amateurs who like to build (homebrew) electronic equipment. We both learn from this one as I assumed that you meant homebrewing in terms of electronic constructions!! Sorry, I can't recommend another group except to say that homebrewing in our sense is often more expensive than buying the real thing.

Likely is OK. The May 98 (?) QST has an article on using the Stamp (v. 2) to build a remote control system for an Icom 706MkII. A friend built it and it does work.

I would imagine there is lots of RFI potential in that setup.

Might also want to call/email parllax re this.

Source record: 80531

Eimac UHF Cavity amp for sale
Model CV-400 w/used tube
Uses 8874 or 3CX400 tube
Good for Continuous commercial power output of 300watts
The tube is good for up to 600 watts out in amateur service.
Amp is tunable from 406-512mhz
RF amp is complete but you need HV and filament supplies and mount it in a rack or case.
The dimensions are H 5.5" W 8.6" D 11.2"
N-connector in and out and and tunable input and output and adjustable cavity size. Could be used for 600watts P.E.P for SSB,
FM or ATV or 300 watts for Repeater use.
$300 +shipping. (eimac sold these for big bucks but then anything with eimacs name on it is too much!)
Thanks,
Jim W3ATV

Thank you Darell,

I think it is the right answer considering only the SNR.

I was a bit puzzled looking in a data book, at the small noise figure of some
GaAS devices : 0.1dB @ 2GHz.

Compared against a cheaper device with say 1 dB @ 2 GHz the improvement is
only 0.9 dB in the SNR.

And if next year they offer a super new product with 0.01 dB @ 2 GHz the
improvement will be 0.09 dB versus the 0.1 dB one.

Rather invest in a new antenna, a shorter cable and better connectors.

From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <35ccc504.0@newshost.pcug.org.au>
Source record: 80539

I would seriously consider using an AM broadcast receiver for the tunable IF instead. The selectivity will be better than with an FM b/cast receiver. The image rejection will be poorer, but in an area where there is not much activity, that won't be a problem. The use of slope detection will produce quite good (but not perfect) recovered audio. Placing a 455kHz FM demodulator in the radio will make it a genuine FM receiver.

A benefit of this approach is if you want to build a transceiver for the repeater. By using a crystal multiplied up to the input frequency, you can have a single crystal for both transmit and receive. This is accomplished by mixing the local oscillator with the mixer in the receive converter. The output is 600kHz - a suitable frequency for tuning in on your AM broadcast receiver.

A converter will require 3 or 4 transistors - less if you already have the local oscillator output. The tuning range is limited to the 1 MHz span of the car radio - enough for most FM activity and repeater outputs.

>stage or at the final or if it should be distributed equally?

There should normally be an audio preamplifier between the product
detector and the audio filter. This could be a 741 or (preferably) a
lower noise op-amp or low-noise transistor stage.

You said there was only one 741 for the audio filter (not sure if low
pass or band pass). If there is room, I'd suggest add another - this
will tighten up the selectivity a bit.

You may need a 741 after the audio filter. This could directly drive
your higher power amp chip (eg LM386).

There is Toronto Scientific & Surplus, which I have visited several times.
Impressive show-room, although crowded (but don't we like it that way?).
Can't recall their address but they do advertise occasionally in QST. Not
far from Highway 401. Their web site is www.torontosurplus.com.

Be forewarned - they are expensive (in my opinion) and not that friendly
toward hobbyists.

1020. Metering Microwave Strength

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-08 00:00:00 UTC
From: jonhillr@aol.com
Message-ID: <1998080822173400.SAA04518@ladder03.news.aol.com>
Source record: 80543

Hello

Sorry...Another request for info. The county put up a large communication tower nearby my workplace. Microwave dishes and other types of antennae are also positioned on it.

I have read that the tower is transmitting some rather high wattages.

Can anyone suggest a means to detect 1) what type of RF/UHF/MF may zinging thru me 2) what the strength of those broadcasts might be.

I am moderately proficient with circuit building and ordering electronic components (ha), tho not RF circuitry. (Off the shelf items ok also).

My recent concern was brought about by someone relating a story about how GIs in wwII/korea would warm themselves in winter by standing in front of mobile radar unit dishes...with subsequently bad consequences.

Thanks for your time

Jon

No they are totally differnt.
The antenna gain shows the equivalent "pickup of signal" gain
as a ratio to the signal that would be picked up by either a single
dipole (in which case it is strictly "dBd") or by an isotropic antenna
(dBi) - a truly omnidirectional antenna.
Antenna gain indicates the ability of the antenna to receive signals
from the 1 (wanted) direction -a measure of "directivity".
The preamp NF is a measure of the noise contributed by the preamp
(it's self-generated "noise floor").. It is mathematically :-
10 Log (input S/N ratio / output S/N ratio). (in dB).
The higher the NF,the worse is your preamp self-generated noise.
1) Has the higher or better antenna gain but the worst NF.
2) Has the poorer (lower) antenna gain but a much better preamp NF.
So,in most cases,the better setup is an *dB gain antenna with a 1dB
NF preamp.
(I'm ignoring several other issues which should be considered like
the preamp gain -highest isn't always best- ,IP3 ,bandwidth,etc.).

I am wondering if there are many wood workers that are also hams? I have an interesting woodworking project that ties in with Ham radio and was interested in finding out how many Hams that also dabble in woodworking? If you are one of these fine people, let me know your call and or e-mail address. I have no intention of soliciting but do have an idea and wonder if I could get some imput from the woodworking Hams. Just a yes I am a woodworker would suffice.

Thanks in advance for your input,

Regards &73

1032. Can You Build This Amp?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-08 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bdc284$3c257000$628a92d0@davidc.bit-net.com>
Source record: 80653
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.swap

I have a pair of solid state RF amp boards, but lack the capability to assemble them into a Ham amp -- if you can, I have most of the information about the critical parts you need to do it.

I need to sell the two RF amp boards, and a complete set of replacement finals, to help pay for a tube amp that I can actually use! :-)

So, if you can build then here are the details:

Solid-state kW amp:

The boards come from the medical field and are shown as 600 watt and were used
in a pulsed mode. The seller (Norm N8RGR), who I got them from, operated them at 400 watts for short periods of time because the heat sink is much to small for continuous operation and will need to be changed and/or a fan added for SSB operation. The boards require 48 vdc for main power and 5 vdc for bias. BNC in and out. They have 3 transistors on them, 1 driver and 2 bipolars in the finals.

The transistors are rated to 30 mc, however, output at 30 mc is very low. Unit has max output at around 14 mc... He thinks the 2 transformers are not broad banded enough and would need to be rewound or the c changed to get a wider bandwidth.

The transistors are a BY1-1 driver and the finals are Acrian S200-50 (bipolar). The finals may be replaced with MRF448. The seller has run them to 450 watts key down with 17 watts of drive. No schematics, however its a single board, probably based on the motorola HF designs....should not be a problem to trace out. The board is mounted on an aluminum plate with the heat sink attached to that. Overall dimentions are 8" long 4" wide. Heat sink is 4" X 2.5" X 1.5 with 8 fins. A larger one can easly be installed
by removing the hold down screws from the transistor's and using the existing sink for a pattern to drill and tap the holes in the new sink.

NOTE: I have been told that the BY-1 may not be a driver but a device used to keep the
finals stabilized or something. This came from a fellow who I met at a Hamfest who says he works with such equipment and was developing a huge amp from four of
these boards and planned to write an article about it with another Ham for publication.

REPLY FROM RF PARTS AS TO COMMON SUBSTITUTE EQUIVALENT DEVICE:
Motorola says MRF448 is directly substitutable.

If you change transistors, you must change all to same p/n.
Specs: f= 1-30 MHz. Po = 250W. Pin @ 30 MHz = 15.7 W. max.
Gain 12 dB min. Same case.
Their on-line catalog is: http://www.rfparts.com

RESULTS OF MY RESEARCH FOR KEY PARTS SOURCE & COST:

Case,hardware,switches, etc. $175.

Surplus 48v power supply $ 75.

Splitter-Combiner $ 85.
Communications Concepts http://communication-concepts.com/splitcomb.htm

7 pole Chebyshev filter $135.
RF Electronics http://users.aol.com/rfelectron/rfelect.htm

Two RF Amplifier Boards $220.

Full set of replacement finals $80.

There would be a need for a feedback/foldback circuit, one of the many things I have no idea how to do but I am sure a technical fellow can whip up from his junkbox!

$770. total!

That's a pretty nice price for a solid state 1KW amp ... considering the prices I am seeing out there for mere 500w solid state amps!

So, I have the amplifier boards and spare finals, and you have the sources for the splitter-combiner and filter ... and the know how. Please buy the boards and spare finals from me and send me an E-mail to arrange a sked when you have the amplifier completed so I may hear it! :-)

73, DavidC AA1FA Please E-mail or call 603-894-1174 9am-10pm EST.

Regards,

I amplify my Ground line at the house and get the Big 1080
AM radio station. No need for any sophisticated crystal set.

To get ELF you would need to filter out the local AM radio
powerhouse. Just keep amplifying and when you get something
filter it out until you just get those hospital employees
transmitting ELF interfering with thoughts.

Telsa called his antenna a sencitive device. Its almost like
you can hear ELF like you can feel sound with a balloon.

Source record: 80658

DSB usually refers to both sidebands with carrier suppressed. Easily
generated and saves the cost of a sideband crystal filter.

The receiver re-inserts the carrier as in SSB. If the receiver has a
sideband filter the received signal is indistiguishable from SSB. So half
the transmitted power is wasted.

With an AM receiver the carrier can be re-inserted with a Beat Frequency
Oscillator (BFO) as for receiving morse code. But it is much harder than
SSB to tune in. To avoid severe audio distortion the carrier must be
re-inserted EXACTLY on frequency whereas SSB is very tolerant to frequency
error.

1038. solar battery charger

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-08 00:00:00 UTC
From: Steve Roach <stevero@inetone.net>
Message-ID: <35CC3657.8495E9AB@inetone.net>
Source record: 80659

Does anyone have a source for solar battery chrger kits? Also maybe two separete kits a solr kit and a charger kit I could put together?
Thanks Steve

1039. Looking for UHF VCO Concept

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-08 00:00:00 UTC
From: Peter Bolch <nc-bolchpe@netcologne.de>
Message-ID: <6qhhqq$mo1@news.netcologne.de>
Source record: 80660

Hi

I'm looking for a concept for a UHF VCO (tuning range 1:1.5) with low phase noise.

What's the best oscillator type (Colpitts, Clapp, common base circuit)?

According to the articles I've read the resonator should have a high Q and the active element should exihibit low flicker noise.

Microstrip transmission lines seem to have a much lower Q than coils made of silver plated wire(at least at VHF frequencies). So, are such coils the better choice e.g. with a Colpitts circuit?

Why are J-Fets like the U310 with their low flicker noise seldom used for UHF VCOs?

Peter

From: Brad Thompson <Brad_Thompson@pop.valley.net>
Message-ID: <35CC458C.6459@pop.valley.net>
Source record: 80662

Hello--
Are there any electronic-surplus shops or browser-friendly salvage yards (with a high electronics content) in the Syracuse and Rome, NY areas?

While I'm at it, are there any electronic-surplus shops in the greater Toronto area? I recall visiting one somewhere downtown (Queen St.?) a few years ago.

Thanks in advance es 73,
Brad AA1IP

Message-ID: <01bdc2d8$14849680$62d9c2d0@hynde>
Source record: 80667

I've got a reciever project that I am finishing up, I'd like to drive a speaker with it instead of just using ear buds, is there a 'laymans' way of adjusting the gains in audio stages. The plans call for a 741 used for 'filtering' around 800 hz (for CW use) then another 741 as the final, I want to replace the last 741 with a lower noise amp then on to a higher power 5 watt amp. Not sure if I should have maximum gain early in the audio stage or at the final or if it should be distributed equally?

Tim

There is a phasing usb/lsb generator in the W1FB QRP notebook it's pretty
small, I built the DSB generator, it has the same amount of components
(more or less) as the phasing type which gives separate usb lsb.

Source record: 80670

A downconverter feeding the bdcst rx would "sort of" work, but has several problems.

The bandwidth of such an IF versus the 5 kHz. NBFM used will produce very low detected audio level and poor signal to noise ratio.

The wide IF may not reject unwanted signals which would be rejected by NB IF.

Another potential problem would be FM broadcast signals entering the IF.

Depending on the FM rec used, frequency stability may also be a problem.

You'd see this in the late sixties and early seventies. Adding a converter to the front end of an FM broadcast receiver. Somebody who's posted in this newsgroup once had an article about it in QST. In at least one instance, someone just modified the front end of the receiver, eliminating the need for a converter.

It was never meant as a permanent solution. It was a cheap way of listening around, and would have been okay back in those days when 2M was underpopulated.

But an FM broadcast receiver has a bandwidth up to something like 280KHz wide. That will take in a good many "channels" used in 2M FM. Also, since the detector is set up for wideband FM, the recovered audio will be very low.

Also, the FM broadcast band is 20MHz wide, while you'd only need a few MHz of tuning. The dials on broadcast receivers are not all that great, and when you try to tune narrow signals in a narrow segment on it, it might be trouble.

In the old days, sometimes there were comments about peaking the IF transformers and cutting out swamping resistors to get a narrower passband, but that sometimes caused the IF to oscillate, and these days many receivers have IF filters in them that allow no adjustment.

So unless you live in an area where there is only one repeater, and not very much activity, using an FM broadcast receiver will not be practical.

One idea back in those days was to convert an AM broadcast receiver, by putting a converter ahead of it. Narrower bandwidth and narrower tuning range. You could either use slope detection for the Fm signals, or add an FM detector to the receiver's IF.

But that too was a temporary concept. Soon, you started to see complete crystal controlled 2M Fm receivers in the magazines.

Although I don't know about convertability, you might look
for an older pager at a hamfest as the receiver.

Or look for a 49MHz walkie talkie, the superhet kind, and either
add a converter ahead of it, or bypass the internal front end and
feed the IF with an external 2M front end. The walkie talkie
will take care of the IF, and you won't have to worry about scrounging
up the IF filters.

I've built a bit-regenerating repeater controller around a BSII - it is constantly working around 50 watts on VHF. As long as you have a good +5VDC power supply you should be set. (A good supply being a 7805, a 10uf cap, and a .1uf cap... =)

The need to note that the Stamps do NOT have a real time clock builtin. If you just need something to satisfy FCC regs, then use a counter and get it somewhere near 10 minutes.

Have fun,

I thought Tim was talking about using the IF of a pager, and (it's not
worded clearly) I think use an external converter that feeds the IF.

I thought the problem would be figuring out how to use it for audio
rather than tone activation. I picked up a couple of Motorola pagers
(for a dollar at a garage sale; I wish I'd bought the whole box) and
it used an IC I couldn't track down and a sort of ceramic hybrid module
so I gave up on using them intact. If the front end is near to 2Meters,
I would think one could just retune it.

Maybe Tim's pager is different and uses common IC numbers. The first
step would be to figure out whether the pager is working, and if an
audio output could be obtained.

If the filter's are in the pager, one could trace the circuitry around
the filters and find the values of the matching components. If it

happens to be the same pager as Ihave, or at least the same filters, somewhere I have the circuit traced out for the filters.

In mine, besides the two 3-pin filters, there is a 17.865Mhz crystal that I assume does a conversion to a lower IF. Not a common IF frequency, though.

This is an interesting point. I've been telling people to look for the
superhet 49MHz walkie talkies at garage sales for complete 10.7MHz/455KHz
FM IF strips. I've also suggested baby monitors and cordless phones,
assuming they'd use the same double cnversion.

A few months ago, someone in one of the sci.electronics.* newsgroups
mentioned that he'd seen some that used something like the Motorola
IC (something like MC3357), but used the mixer that normally
went from 10.7MHz to 455KHz as the first mixer, and converting straight
down to 455KHz. I picked up a cordless phone at a garage sale in June
for three dollars, and yes, it was single conversion only, going straight
to 455KHz.

I don't have the boards handy, but I thought they had an FM bandwidth
455KHz filter and perhaps the rest of the IF is useable. But keep in
mind that the cheap ones may not have a 10.7MHz ceramic filter, or
the 10.240 MHz crystal to convert that to 455KHz.

>
> *Remove 'o' from hynde@flash.neto to reply.

There is certainly no reason why a MAR-2 or similar MMIC couldn't be used as an IF amp. However, unlike the 1350/1590-style parts, these parts are not designed for AGC control, so they will be much harder to use in a variable-gain application.

The MMICs are also optimized for 50-ohm source and load impedances, which may make filter termination and matching more difficult (or not, depending on what filters and transformers you're using).

Finally, there's not much point in using a 1 or 2 GHz-rated MMIC in place of an MC1350 in an HF IF amp. You will have to cascade several MAR-2s to get the same total gain available from one MC1350, and you'll have to be careful to avoid oscillation, which could take place at frequencies you can't "see" with your scope.

It's hard to see any compelling reason to use MMICs for that kind of application, unless you're operating above the 1350's frequency range, and/or don't care about AGC.

1056. Re: Metering Microwave Strength

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-09 00:00:00 UTC
From: Carl Bauman <cbauman@impulse.net>
Message-ID: <6qls7s$fe7$2@sienna.impulse.net>
Source record: 80479

Personally, Jon, I think you're overly worried about this situation. Trying to equate how GIs, through ignorance, (let's be charitable) would slow roast themselves (you never specified the bad consequences) by purposefully standing directly in front of a radar dish to your situation with a new microwave communications system, which loses too much signal if it's forced to go through buildings or people, will make you seem foolish to others. (it *might* have been moved there to get a clearer path or to allow a large building to be constructed where it was originally sited.) If you can see that the dishes are not pointed *directly* at you, there shouldn't be a problem with them. As for the other antennae, the major lobes probably send most of the energy over your head *and* the energy you *do* get from them falls off rapidly with distance.

If you still need to find out for your own peace of mind, getting in touch with whoever is maintaining the site for the county could tell you what the frequencies and power levels are for each transmitter (rounding the frequency to the nearest 10 MHz is adequate). The power levels where you work can be calculated or a *calibrated* field strength meter can be used. Field strength meters come in two varieties, ones that show the total energy, but can't tell which frequencies are causing the readings and ones which actually tune through the frequencies and indicate the signal strength, but not the total energy. Guess which is more expensive??? Now, you can build an uncalibrated field strength meter, but all that gives you is relative readings. Even using a spectrum analyzer with an antenna to monitor the frequency band of interest will only be good for relative readings, unless the whole system is calibrated.

You might see that this is not exactly a do-it-yourself project, but if you really mean to pursue this, maybe some environmental or workplace safety group may want to check on it. Note also that the maximum RF exposure limits change with frequency.

I hope I at least set your fears to rest.

Try MFJ also. I think that they now have the license to the chip per a note on the Curtis web page I saw last fall.

The only practical solution I can think of is solar panel(s) and deep cycle batteries. How many depends on the watts your radios uses and the duration you use them. a 75watt panel cost approx $420 and deep cycle batteries cost approx $50-75 each. I don;t know if this is a do able thing as far as your budget goes.

Bob:

I've used PIC chips (not the Stamp, but the 16C55) without any problem when
subjected to 10+ watts on UHF (441.XXX) and 50 watts at 2 meters. No special
precautions were taken and the enclosure for the unit isn't even RF tight.
In my application, the PIC unit (which serves as a controller) sits directly
on top of the UHF RF deck and directly next to the 2Meter radio.

Hope this helps relieve your issue to some extent.

I haven't had any problems with the PIC devices either, provided they're properly bypassed on the input voltage supply line.

I built the "electronic mosquito repeller" using a 12C509 which was on the Microchip webpage in an application note. I've had it setting right next to the HF rig (TS-440) while operating, and haven't noticed any problems with the rig or the device while it's running.

And it does seem to keep the critters at bay!

Hi,

I'm interested in building a 'hands free' noise cancelling mic. for mobile use.

I plan (or hope) to use a couple of electret mics- one on a boom need the drivers position the other further away to catch the background noise.

Has anyone any pointers or existing designs, please.

The rig, at least initially will be an Icom handheld (until I get permission from
the XYL to buy a new mobile ;-)

Thanks

I've used the 1350 because:
1) It's inexpensive ($1.50 or so)
2) I can get 'em off the shelf locally.
3) They work well and there's lot's of designs published using it.
3a) Their AGC range is good and they will adapt to just about any
AGC loop without difficulty.

Not that I'm opposed to using anything different, for me it's just been
kinda hard to get past the above reasons for using the 1350, hi.

I'm showing my ignorance here, but where can I find out more about the MAR-2
you mention?

The MC1350P has a pin for controlling gain. If you use an MAR-2 (to
briefly answer another's query, it's a three-terminal wideband amplifier)
you'll have to add some stage somewhere for controlling gain for AGC
purposes.

The MC1350P drops off in gain as you increase frequency. It's still
good at 45MHz (I don't know if it was ever used in TV sets, but
Motorola data sheets show it in TV set IF's), but it's gain is already
dropping off. The MAR-2 is good up to the 100's of MHz range, at least.
I've seen comments about the need for good layout with the MC1350P,
so I would imagine you'd have to be more careful with the MAR-2.

The MC1350P is more adaptable. It has differential input and output,
which is ignored in most uses but could be put to use. The outputs
are open collector, allowing for a choice of resistor output or tuned
circuits. Or you could try something new on the outputs.

The variable gain stage is in fact a "Gilberte cell"; ie a double balanced
modulator, same as the MC1496 or NE602 (or a lot of other IC's). If your
application allows for a gain stage after the balanced mixer/modulator,
then you might be able to get by with an MC1350P, which might be easier
to find than an IC which sets out to fulfill that function.

I've yet to come across MAR-2's, but I have found MC1350P's (or their
metal-can equivalent, the MC1590G) on surplus boards.

If I was trying to build an IF without having to get a MC1350P, I'd
think about using discrete components. Not as elegant, but you're
bound to have the parts on hand. Just look in older ham magazines or
Handbooks for suitable circuits. Usually they included some scheme
for controlling gain by voltage for AGC purposes.

Tim ... using a broadband amp with nearly flat gain to
2GHz as an IF amp (presumably at much lower frequencies)
is asking for unnecessary trouble ...

I once was asked to go in as a consultant and wring the bugs
out of a receiver that some employee (I hesitate to call him an
"engineer") at a client company had "designed" ... the IF was
at 45MHz and he'd used 3 MAR-x stages in series to get about
50 dB of IF gain ... problem was the thing oscillated like a
banshee at 1.5GHz ... you could "tune" that L-band
oscillation by pressing on the case ... ugly.

Most devices designed for IF use roll off fairly fast above
the range they were designed for ... I would suggest you
look around on the web ... try:

Analog Devices http://www.analog.com
Motorola http://www.design-net.com
Philips http://www.semiconductors.philips.com
RF Microdevices http://www.rfmd.com
Siemens ... http://www.sci.siemens.com

There are a LOT of slick IF devices out there ... certainly
more modern and better performing than the 1350 ... that's
old as dirt.

Anyway, find a decent, modern IF device and avoid the
problems of all of the untamed gain of a string of MARs.
MARs are very useful when properly applied, but stringing
them together for a high-gain IF strip is NOT a good
application.

IOk, I've nixed the FM broadcast idea and picked up a couple Motorola voice pagers that have a 3 pin crystal at around 17.9 MHz I assume this is part of the IF filtering.

I don't have a schematic, but if I mix the front end so my output is on that freq can I cut the trace and apply the signal directly to this crystal?

Tnx

Tim

IF the "3-pin xtal" is a monolithic xtal filter, it probably requires some
impedance matching to maintain the passband characteristic ... without
knowing the filter's characteristic impedance it may be difficult to arrive
at the correct matching network ...

Good luck.

[...]

The output coupling pretty much has to be transformer. The spec allows
one side of the differential output to be cut off completely and the
chip still meets spec.

Best Regards,

Mike

Hi
Of course it pays to pay attention to cables and connectors and keep
lossess down. But as I see it you make an erronous assumtion here!

While calcualting noise figures in dB the assumtion is that the T=293
Kelvin. This is true in many cases but NOT in VHF and up!

To do a proper nose calculation you need to revert back to noise
temperatures and add it all up and then go back to noise figures in
dB. Then you will see a big improvement in S/N. And this is of course
what you want!!

Cheers

Source record: 80484

TOTBOMK
UHF oscillators are using stripline resonators for several reasons,

Easy to reproduce
Not very sensitive to microponics
Physically small

There must be many others that I forgotten. But HIGH performance do
not come cheaply not it size nor in complexity!

Often in an phase locked source you do not need the very low close-in
noise as the PLL cancelling it. But then you need low divisor numbers
and a low noise reference.

One desing I saw a couple of years back was using swithced
transmission line resonatning at SHF, 75 ohm hardline, and then
divided down to UHF. This would give the resonator high-Q (physically
big at these freqs), and not that complex.

Why not use U310, well people do, but it have a much lower usable freq
range than new bipolar transistors. Best noise is when using it in a
grounded gate, and have my doubt it will give enough gain to sustain
oscillation above 400 Megs.

Cheers

1089. Re: Using FM broadcast RX as IF.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-10 00:00:00 UTC
From: spam@nospam.com
Message-ID: <35ce9aba.2021109@news.lin.foa.se>
Source record: 80485

Years back when I was a teeny-weeny kiddo, the mail-order catalogue had an item named MINIX.
This litle gadget was really a mixer-oscillator, allowing a standard 88-108 MHz transistor radio to operate as a police/emergeny receiver.
Wow, and only for 5 bux!!!

Did work.... not really, the output from the converter was a wire with an alligator clip to attach to the transistor radio whip antenna. Low sensitivity, wide band demodulator and finally a rotten band-spread on the transistor radio made the thing pretty worthless.

But then suddenly we could hear something, maybe the police saying something, Gee we were exicited. This lil box kept us busy for weeks.

Mayby this is what you need??

Cheers

From: spam@nospam.com
Message-ID: <35ce9f35.3168804@news.lin.foa.se>
Source record: 80486

Hei Jan-Martin
looking at the schematics at the 901/902 shows similarities and
differences!

The preamplification is the same using a dual-gate fet as the active
device. Why? They are using a tuned filter just like in the Drake and
using the high impedance of the input of the fed to be coupled to the
filter. To change this would mean replace or rebuild the whole
preselecor. Possible yes, worth it ??

The following mixer in the 901 using j-fets, and in the 902 quad-diode
ring mixer plus post amp using j-fets.

Performance wise the two radios are pretty much the same. I suspect
that the RF amp and the VCO noise are the limiting factors. Rebuilding
the radio would more or less mean to just use the box and replace the
RF-parts....

Go get a modern radio and keep the 901 as a nostalgia. I keep mine coz
I can't afford a new....

Cheers

Compared to the IRF510, the IRF520 has about twice the input capacity.
This may lead to problems at higher frequencies. In Your case of 80m and
40m it might still work, though

Why is it not true in VHF and beyond? In my opinion, frequency doesn't
matter in converting from noise figure to noise temperature and back
(if done correctly).

In constructing ladder filters using crystals for IF's should they be series or parallel resonant? Looks to me like they should be series but one reference I saw a long time ago said parallel but that was refering to a single crystal BPF. I want to use 4 or 5.

1096. Re: Q about noise figure.

Newsgroup: rec.radio.amateur.homebrew

Source record: 80492
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Deeper analysis in this field is not really best done by me but......
At higher frequencies having an antenna with gain, the noise
temperature of the antenna can be lower than 290 degrees . This is
especially true when pointing the antenna up towards the cold sky.
Take for example EME! The anenna noise can then be 30 degrees kelvin
compared to 2000 K when pointing to the hot earth with all its noise!

This is why it is so important to have low-noise temperature on a
micro wave amplifier. Look on any TVRO LNB for C-band! They all shows
noise temperature. A drop from 100 to 30 degrees would hardly be
useful IF the calculations are done with noise figures assuming
To=290 degs. (Please explain why 12 GHz LNBs are shown with
noisefigures in dB.... coz I can't)

So you are correct the frequency dosen't matter when doing the
convertion but, you must think of the whole system and especially the
surrounding noise, atnenna noise temperature!

If the sky-temperature is zero (ok just an impossible example),
lowering your front end noise temperature would improve the S/N all
the way down to zero degrees!

But if say the sky have a noise temp of 100 degs, and your rx have 193
degs your system senitivity have 3 dB NF. By lowering the rx tem down
to say 30 degs would give you a system temperature of 130 degs or 1.6
dB. Shooting for a 10 kelivn amp would give 1.4 dB. Clearly this
example shows that is a waste of money using a super-low noise amp in
this example ....

Cheers

I hope this did not make the issue more complex.... Maybe someone with
a deeper understanding would and could explain it much clearer and
better??

I have the following Heath items for sale:

SB-610 monitor scope. Working order, but not all parts are original.
Horizontal gain control has been replaced, and has no knob.
Sweep freq knob and tone gen knob are missing the chrome colored ring.
Cabinet is fine -- a bit dirty, but no dings. No feet.
CRT and HV caps seem good, as it is working fine. No manual. $ 70

IB-1101 freq counter. Works great, looks great. As far as I can tell,
everything is original. Manual is included. $ 65

GC-1107 digital clock. Works great, looks great. Everything appears
original. $ 25

I have the following Heath manuals available. All are in good condition.

IO-103 Five inch scope $ 12

GR-2000 TV Set $ 12
GR-2050 TV Set - Five book set $ 30
GRA-2000-1 TV Clock $ 3
GRA-6001 TV Clock $ 6

Prices do not include shipping from Florida.

73,

Ken, W8EK

1099. 433MHz Power Amp. and Tx/Rx Switch Recommendation

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-10 00:00:00 UTC
From: Artur Leung <aleung@engr.ukans.edu>
Message-ID: <35CF0E66.6F0E6FD9@engr.ukans.edu>
Source record: 80495

Hi,

I am designing a low-cost FSK transciver using a FSK transciver IC (RF Micro Devices RF2905). It can put about 5-10dBm of RF output (Vcc=5.0V) to the antenna. Do you have any recommendation on power amplifier (single supply at +5.0V) that takes the output of the transciver chip and pumps out several watts to the antenna? That amplifier would be low-cost and easy to apply. If you have any recommended circuit(s), please let me know.
Also, do you have any recommended TX/RX switch to handle this power? The transciver chip's RF TX out and RF RX in are tied together to use a common antenna. Itdoes not require external TX/RX switch to handle the RF power by the on-chip RF TX output. However, if a power amplifier is added, the receiving front-end cannot handle several watts of power and will be destroyed without an external TX/RX switch. Preferrably the switch should be operated with single +5.0V supply.
Thanks for any information!

I think what he is trying to say is that at VHF and up the antenna is
often sufficiently directional that the warm Earth isn't in the main lobe.
Thus the assumption of a 293 K source isn't valid. You may be looking
at a cold sky temperature considerably below 293 K.

Radar systems often work at kilowatt or even megawatt power levels (though
that's usually pulse so average power is lower). Communications links never
run that sort of power. "High power" for a microwave link would be 10 watts,
most run at 1/10th watt or less.

Unless you are boresite with the dish, and very close (a few feet), you won't see
anything approaching 10 watts. And this has to be converted to a flux density value
in watts per square centimeter to determine exposure. Assuming a 1.8m dish,
the flux density at the dish is 0.1 mW/cm^2. That's already 10 times below
the legal exposure level. If you are off axis with the dish, your exposure will
be 30 to 40 db less, IE well under a microwatt per square centimeter.

So to measure your exposure, you'll need a calibrated microwattmeter and
a calibrated standard gain horn antenna. You can build both, but calibrating them
requires access to standards you probably don't have. You shouldn't be at
all concerned about exposures at this extremely low level. Using a cellphone
exposes you to RF levels thousands of times greater than anything you could
possibly get from a microwave communications link (or from a cell site in
your back yard for that matter).

>(probably)

They'll work for a few cycles, but repeatedly deep discharging an auto battery quickly kills it. Deep cycle batteries aren't that much more expensive, so it makes sense to use them instead. Of course if you already have some car batteries you're willing to expend, go for it. Realize you won't be able to use much of their capacity. You have to keep the terminal voltage up to run the radios, and that limits how much you can discharge them. NiCads would be better, but much more expensive. Edison cells are another battery alternative.

>>The only practical solution I can think of is solar panel(s) and deep
>>cycle batteries. How many depends on the watts your radios uses and
>>the duration you use them. a 75watt panel cost approx $420 and deep
>>cycle batteries cost approx $50-75 each. I don;t know if this is a
>>do able thing as far as your budget goes.

BTW you can find surplus solar panels for less than that. Their efficiency may not be as good, and you'll have to build your own frame and add your own self-discharge prevention Shottky diode, but it can save you a few bucks. If you have good winds, average over 15 MPH, then a WinCharger may be more economical. But if winds are lighter, or sporadic, the solar panel is probably a better choice.

The ideal situation would be if you have a stream with a reasonable amount of fall accessable to you. A microhydro generator system is generally the most cost effective alternative power setup you can have. Commercial microhydro systems aren't all that expensive, but you can build your own undershot wheel and V-belt it to an auto alternator salvaged from a junk car. Cost zero. (Use a GM alternator with intergral voltage regulation.)

Mother Earth News published a book entitled _Homemade Power_ which details setting up your own microhydro plant. It tells you how to calculate how much power you can get from a given stream volume and fall (it takes surprisingly little flow volume and fall to get respectable amounts of power). The book also details wind power setups (but homebrewing them is difficult unless you have consistent strong winds, efficiency is hard to achieve without good airfoil design and very low drag bearings and gearing). It even tells you how to run an IC engine generator off methane produced by digesting wastes. The latter probably isn't of interest unless you run a pig farm.

It's always possible. How you do it, and whether it's worth doing
are what you need to decide.

I use a modified Pro-43 for APT reception from NOAA and Meteor
satellites - it worked fine as is (albeit with help from a homebrew
BF981 preamp and a homebrew quadrifilar helix antenna), but
replacing the 455 kHz IF filter with a 10 nF capacitor did wonders
for fine detail.

Source record: 80502
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Be careful. When something like a TVRO LNA specified as 100K (or whatever), it is not physically at 100K. This is the "equivalent noise temperature". It is a mathematical convenience and if a resistor is heated to this temperature, it produces the same amount of noise that the amplifier does. (i.e. noise power available = kTB)

In fact, it is directly related to noise figure: Teq = To(NF-1) where NF is the noise factor. It is equally valid to do the calculations in either Teq or NF. And, in fact, you will see the Friis cascade noise formula written in both forms. If you substitute the above relation in to one of the formulations, you'll get the other.

There is a third although less common way of specifying noise too -- equivalent noise resistance. I.e. what value of resistor @ To produces the same amount of noise as the amplifier.

Which one I use when making a calculation is simply a matter of convenience -- they all are equivalent.

Thanks,
Darrell...

I'm not sure a single PIN attenuator is a great AGC solution in the general case. Where do you put it? In front of the IF strip? If so, then your IF strip is always running at full gain and contributing tons of unnecessary noise to the audio (not a problem for FM, obviously, but it would be for any other mode). Or after the IF strip? Sounds like it'd be bad for dynamic range, unless you're using really high-level MMICs in the strip.

If you can't or don't want to use an integrated variable-gain amplifier, then a string of dual-gate MOSFETs with AGC applied to each stage might still be preferable to MMICs.

the problem is not the possible power level but the supply voltage, it
is just too stupid to design an amplifier for 12-14V supply voltage,
particularly when used at home only

I don't care for the nostalgia of this set. But I really hesitate to look for another rig because it usually takes me over a year to modify the 'rubbish' and make it work as desired and remove bad symptoms, several modifications are needed on any HF rig because my main application is with VHF/UHF transverter. Spurrs which may not cause too much troubles on HF is worse when listening to quiet VHF bands.

Yaesu rigs often have facilities for transverters, but I do not want another Yaesu rig. Kenwood does not usually have such facilites and modifications may be difficult, a too large rig may be impossible to modify, SMD-technique does not invite us to modify the rig!

Steve

For what is worth, I collect and restore vintage radios and communications
receivers. My test bench is all solid-state, but I really enjoy
the old tube technology. Its nice to see machined gears and real steel
in lieu of formed plastic and faux chrome trim. I'll admit my old
SX-28s don't work as well as the newer SWL receivers, but
I wouldn't trade one for anything.

All diodes have a characteristic capacitance that can be varied by applying a reverse bias voltage. If you use a diode as part of a tuned circuit, you can tune the circuit by changing the capacitance of the reverse biased diode. This is what Voltage Controlled Oscillators (VCO) are all about.

For more information, check the ARRL Handbook. There are a number of examples given there.

I guess that both mics must be close to each other, back-to-back.
Noise cancelling by subtracting the background signal works only if you
are strictly in phase. This means that the distance between the mics must
be short compared to the wavelength of the to-be-cancelled signals.

Just my idea ...

No, you aren't mistaken, there are VCO's around still. I looked in my latest handbook and the index didn't have 'VCO' in it, but it did have 'Oscillator, Voltage Controlled'. Amusingly, the advantages and disadvantages, IMHO, are that it's voltage controlled! Even if the circuit is stable with no controlling voltage applied, using a voltage to control the frequency means *any* voltage change results in a frequency change - not good for SSB or some other modes. OTOH, controlled by the output of a comparator in a phased-locked loop or a discriminator, and you have a nice frequency synthesizer or AFC.

I used them when I needed a wideband, flat gain 45 MHz. IF for ATV. For
AGC, used a homebrew pin diode attenuator. Believe it had about 60db
range...
The MMICs were not simply in series. A number of filters (coupled,
double tuned circuits) were inserted between the stages, taps matched to
50-75 ohms.
Woody

1123. CadSoft EAGLE v3.55

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-11 00:00:00 UTC
From: BILLkresl@elknet.net
Message-ID: <35cfb7ba.0@tornado.tcccom.net>
Source record: 80510

CADSOFTS's EAGLE version 3.55 for WIN95 is another FREE program that is being given away -as long as you use it for non-profit use. It has BOTH a schematic capture editor and PC Board router, tho the LIGHT version of this program limits your creations to double-sided board dimensions of about 4"x3". Apart from these three limitations, the EAGLE Light Edition can do anything the Professional Edition can do. You can even load, view and print drawings that exceed these limits.

What does "non-profit" mean? If you earn money by using the Freeware version of EAGLE Light, you have to register it. This allows anybody who wishes to use EAGLE Light for their private hobby projects to do so. Also, students can use this version for any educational projects.

This EAGLE LIGHT software is being offered in English and German languages for WIN95/NT, DOS and OS/2. The WIN download is about 3.8MB, in addition you will need to download a small LICENSE.TXT file that contains a ten character alpha KEY that needs to be entered (view it with any editor) when installing the program. Put a copy of the LICENSE file on a floppy as it contains an encrypted version of that ALPHA key that it will need for the install. For the download:
http://www.cadsoftusa.com/cgi-bin/download.pl?dir=pub/demo

CadSoft Online homepage:
http://www.cadsoftusa.com/

P.S. I am not connected with this firm in ANY way. Just a ham radio hobbyist that heard about this program from a German ham via an e-mail discussion group. I downloaded and installed it, and was quite surprised by its capabilities. YMV.

I'm looking for a newsgroup or website that'll provide parts list and instructions to build a small LPA for my CB. I'm hoping for a 50 watt boost for the mobile unit. I get far from my home often now and would like to be able to hit the base unit from more than 3 miles away. Can you help me? Please e-mail (don't forget to remove the NOSPAM from the header) me. I don't know if I'll remember this newsgroup. I haven't set my reader up to get this one. I only got here from a WWW link.

TIA,

There's a whole subculture of audiophiles who hear "warmer" sounds from tubes. A technician I used to work with kept busy in his spare time building 50 watt class-A amplifiers with giant transmitting tubes. That's where the action is with tubes* these days.

Of course you can. Go to the reference section of your library, and ask for their Inter-Library Loan service. They can order books for you from all over the country, and will order xerox's of articles in magazines...It's all "free" for your taxes.

One of the articles you want is "High Performance Crystal Filter Design" by Bill Carver in Communications Quarterly Winter 1993 issue. (There's a typo in one of the equations, it ought to be ((Rt+Rp)/Rp))

You would serve yourself well to purchase Wes Haywards "Introduction to RF Design", you can buy it through the league. It has software included (L.EXE and X.EXE among other programs) that takes all the pain and agony out of designing ladder filters. The rest of the book is magnificent too, and belongs in any homebrewers library.

>I'm wondering if anyone else is doing anything with tubes other than single
>tube xmitters and simple receivers?

Steve,

Lots of people still enjoy working with tubes. I'm currently building a three tube (and two transistor) transmitter for 40 meter CW. Tubes tend to be more forgiving of mistakes in tuning and initial setup. Back in the 50's I had a transmitter with an 807 that had a hole in the plate from being left off resonance too long, yet it still functioned. Transistors just go pop, and the tuned circuits are somewhat more difficult to construct. I suppose there are a lot of arguments both ways, but a tube transmitter is elegantly simple and reliable if properly constructed.

>What's a Flying Beer?

Don't know. I remember we used to build microwave tranceivers using 1/2 quart beer cans, a 2K21 klystron and a radar diode back in the 50's, but I don't think that's it. What I am describing was called a Polaplexer.

Eric,

As I'm sure you know, and others will point out, adding an amplifier to a CB system is illegal. I suggest you consider that your goal of greater than 3 miles is easily attainable by careful selection and matching of your antenna systems. Lowering your SWR, or using a base antenna with a little gain (like a 3/4 wave "J" or colinear) would be the equivalent of boosting your transmitter power to 40 watts - legally.

I've used tube amps and transistor amps in the kW range, and frankly, the
transistor amps I've seen were just too finnicky. The tube amps still
provide a reliable method of getting these power levels.

1133. Question on VCO

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-11 00:00:00 UTC
From: J Samuel <jaysam@deletethis.deletethis.caa>
Message-ID: <35D04C22.5B94@deletethis.deletethis.caa>
Source record: 80520

Hi,
Many years ago I had come across a circuit for a Voltage Control
Oscillator (VCO). The person who gave me the circuit said that the freq
can be controlled using a potentiometer. It has been about 12 years
since that and I have lost track of the circuit and the person who gave
it to me. I have had a renewed interest in amateur radio and looking
through various home brew projects I cannot find a VCO design. There are
VXO's, Xtal controlled Oscillators and VFO's but no VCO.
Am I mistaken about such a design (VCO), if not where can I get some
more information and what are the advantages/disadvantages of a VCO.
Please post replies to this newsgroup and thanks in advance.

Gee Eric, you've just announced your intent to violate the law in a public forum ... if the FCC still had an enforcement division you'd have given them cause to enter your home and check your equipment. No licensed Ham will provide information because to do so would be to enter into a conspiracy to violate the law or to at least to be an accessory -- and that could cost them their hard-earned license.

Just thought I'd explain why the silence will be deafening from this Hams on this newsgroup. Hams love to help ... but they have signed a form saying they would obey the law ... it's a condition of getting a license.

Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday August 16th 1998
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

A VCO is basically a VFO tuned with a variable capacitance diode,
instead of a conventional capacitor.

They work great on a wrinkle finish (actually better than a smooth finish).
I use them all the time. Have for the last 20 years.

> tjwood@va.tds.net

Hi Ted, I have converted a couple of 49MHz to 50MHz. The 39.130 Xtal is the rx local oscillator. It is 49.830 - 39.130 = 10.7MHz IF. THe 16.61 MHz Xtal is the tx. It is 16.610 * 3 = 49.830 MHz.

The 10.245MHz is the second local oscillator. 10.7MHz - 10.245MHz = 455kHz.

I found some junk box xtals to put my about 50.900 MHz. I also needed to get away from the baby monitors. The reciever and transmitter tuned up without component changes. My xtals worked out to be 50.900 - 10.7MHz = 40.2MHz for the rx. The transmit is about 16.9666 MHz * 3 = 50.900MHz. I had to pad the transmit xtal about 10 kHz because that was the closest cut that I could find.

A xtal company could cut you some rocks quite cheap.

I also had some CTCSS encoder-decoder boards that I shoe-horned into the cases so that noise doesn't make the squelch pop (6M can be a noisy band).

Allan VE6XK

since you guys brought this up, I would like some information for educational purposes only of course. I bought at a flea maket a unit that appears to be brand new and it appears to be a linear amplifier. It says killer bee dx 250 hdv on the front panel. It has push buttons for power, rec amp, and am. There is a dial marked min to max, and a meter for rf output marked 0-10. On the back is a rocker marked ssb off and on. It has rf jacks in & out and the power cables. I'm ashamed to tell how little I paid for it. Can any one tell me the functions of each control, what the power requirements are (12volts?) and what frequency band this was designed for? The guy said it was for cb but since this is illegal, what is its proper use and how many watts output can be expected?

I had some adaptors made for prototyping with the AD9850 on a PCB
groundplane. It wasn't very expensive (they were single-sided with no
holes), and I sold the ones I didn't need. You'll find it quite
difficult to make PCBs at home to take the AD9850, the pad spacing is
0.65 mm, and I used .008" tracks on my adaptor to keep the thing as
small as possible.

I used EasyPC Pro. XM to design the adaptor, and generate the Gerber
photoplot file.

Soldering the chips wasn't a problem, I tacked down two opposite
corners, then splodged solder all over the pins with a soldering iron,
removed the excess with solder wick, and then reflowed each joint with a
very fine tipped soldering iron, using a magnifier. I had a small batch
assembled by a local SM specialist co., they had an operative with very
good eyesight who soldered them manually with an expensive soldering
station and fine solder - no optical aids. It only took him about 20
minutes to do 12 adaptors, so it wasn't very expensive.

Hi Eamon OM,
Yes, there are lots of us running all homebrew gear out here. Most of
us are on CW, and a few, like myself, also use FSK.
My XMTR is one I threw together several years ago, using a pair of
IRF522's in the final amp (75 cents each). Puts out an easy 40-50 W
class C on 40 Meters (I am not a fone man), using a surplus 24 VDC
switching power supply. I drive them with a single 2N3866 Class A stage
(1 watt out), which is in turn driven either by a VCXO or AD9850 DDS VFO.
I highly recommend using more than 12 V for the drain supply on the amp, as
you will get much more power out at increased efficiency. I can drive my
pair of 3-500Z's in G-G if needed, for about 400 W out. This provides
variable power out from <1W to over 400W,. as needed.

Source record: 80437

Hopefully you guys can help me with this. I'm working on a DC receiver. For simplicity and later connection to a PC sound card for demodulation, I was wondering how much AF amplification would be necessary. If RF attenuation can be adjusted from 10 to 30 db would 120db of AF be too great?

I was planning on using op-amps for the filter and AF amp. If 120 db is required would it be best to have stages of say 20db each?

many thanks for listening, Ian

>
Actually There is a pretty straightforward to enhance the
effectiveness of a mobile CB.
All it takes is a little rewiring.
You will need two chunks of RG8/U Coax and a T connector One male and
2 females PL259
Fit the T connector to the antenna Jack on the radio. Connect the
antenna to one female and run a length of RG8 from the other fr\emale
to the the one of the leads that are around the distributor cap.
take the other length of RG 8, use it as power cable running directly
to the battery, but be sure to reverse the polarity to the radio ie
hot goes to what would normally be ground on the radio and visa versa.
Besure to have the radio off when starting the car. Turn it on the
the overall quality of the CB's effectiveness will be enhanced beyond
y9our wilkdest dreams.

A-ha!
You only use the rig as a driver for VHF/UHF, then this opens up a whole new perspective!

I assume you only use 28 MHz as IF, why not discard the whole RF sections and desing your own filter/mixer set-up and then use the IF on the 901.

But you would get better performance out of an 101ZD! Why? Well the 101 did not use the PLL cleaning-up loop and hence do not generate as much phase-noise as the 901. They are using the same filters and I guess the IF is pretty much the same.

But then again building a single band tx/rx with high performance would not be a problem, would it?? I am sure you could easily match the performance of the 901!

Cheers

Have you not checked the circuit? What is the grid bias doing? Remember
the NAG
only switches the grid bias, so if you have burnt out some part of the
circuit by using too much power input, leading to high grid current, you
will possibly see this effect. The other more likely problem is you have
ruined your output valve by overheating the grid. Just order a
replacement, probalby only cost you $300 or so.

The 4CX350 is not designed to run any grid current. Putting 25W in and
trying to use the mic gain to reduce power without the application of a
level clipper or speech processor before the mic input stage is an action
that ought to lead to a license downgrade.

Don, I also want to try AD9850's as VFO.
My problem is getting the pcboard with pattern for the AD9850 and
soldering the IC onto that board.

If you used a commercial source for artwork, pcboard, and install, can you
provide info? Was the 9850 VFO a commerical kit?

Can you provide details how to make pcboards at home that can accept AD9850's
and how to solder them onto board at home? Software, etc?

Thanks for any hints, 73, W6MIK

Yes, but only diodes with a PIN structure have carrier lifetimes long enough to handle the forward bias during half the RF cycle. Just any old diode will not be satisfactory at either very low or very high frequencies.

If you use the microphone input of the sound card, the signal
level needs to be about -55 dbm. The weakest HF signal you can
receive is set by atmospheric noise. From lower HF to upper HF
that can vary between about -123 dbm and -140 dbm. Figure your
DC receiver mixer is -6 db, so you need between 60 db and 80 db
of audio gain in front of the sound card to work right down to the
HF noise floor.

The strongest HF signals you may receive can be as much as +20 dbm,
though more typical values for strong signals are -20 dbm to -10 dbm,
so you need up to about 100 db of variable attenuation in front of the
receiver to achieve gain leveling. Of course if you do gain leveling in
software, you only need enough attenuation to prevent driving your
audio stages (including those on the sound card) into saturation.

The A/D in a sound card has a dynamic range determined by the number
of bits used in the conversion. This is given by 20*log(2^(N-1)), where N is
the number of bits. So an 8 bit converter has a dynamic range of 42 db
and a 16 bit converter has a dynamic range of 90 db. But the analog stages
in front of the A/D may have a lesser dynamic range than that.

You really don't want to forward-bias the varactor at any point during
the cycle.

For waveforms, see "SPICE Analysis of a Colpitts Oscillator" at

http://www.csolve.net/~add/colpitts/colpitts.htm

(May take some time to connect - having problems with my ISP lately)

Best Regards,

Mike

From: Artur Leung <aleung@engr.ukans.edu>
Message-ID: <35D1BEE6.DB0E9199@engr.ukans.edu>
Source record: 80459

Hi,

I would like to build a low-cost FSK transceiver which can pump out several watts of power and tx/rx at moderate speed (like 9600bps). Since I am very new to designing RF transceiver, it would be great if someone could help me on this issue. Preferrably I would like to use ICs instead of discrete components for transmit and receive. At this point I could only locate Motorola's MC2833 for the transmit function and MC3363 for the receive function. Please advise.

www.electronicsforu.com/efyhome/circuit/cir59.gif (it may not be great but looks interesting to me). I have been unable to find T1(2n2904a) and am looking for a substition or if it has some other name or might be a mistake or whatever. TIA!!!

1172. Wide band VCO and low harmonics

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-12 00:00:00 UTC
From: spam@nospam.com
Message-ID: <35d1c63c.387300@news.lin.foa.se>
Source record: 80463

Hi
a friend wants for some reason to build a VCO covering 30-90 MHz with an output of +13 dBm and keep the harmonics and spurs down at -50 dBc. With this wide band coverage filtering would need a tracking filter as a low-pass would do no good until the VCO is over 45 MHz.

Oh! I forgot to say the oscillator is to be swept so a switched filter bank is out of the question.....

I suggested a higher frequency VCO and mix it down to the desired 30-90 MHz and by carful filtering, only the 3RF-3LO would show up as a troublesome spur. Of course the preceeding amplifier needs to keep the harmonics down. My guess is the output amp needs to have at least an IP2 of 65 dBm ! This would of course be possible with an balanced amp.

My friend insist he would rather use a single wideband VCO, as he is not all that familar with RF.... I guess by placing the output after the resonator, i e using it as a tracking filter would keep the harmonics to a fair level.

What would YOU choose?? Lets have some constructive ideas PLEASE!

Cheers

Looks like a fairly generic PNP silicon, similar to the NPN 3053 they are
calling out, but the opposite polarity. Drop me E-Mail, and in the meantime
I'll look it up.

HI Dave OM,

If you want to tinker with Surface Mount (SMT) parts, it just takes a
bit of practice.
I usually do not make PC boards for my projects. I build them
"ugly-style", as it is
usually not worthwhile to go to all the trouble to make a one-off PC
pattern, since you will
likely change it anyway, which is the nature (and fun!) of homebrewing.
Forget about
how commercial gear is made; they have different priorities,
particularly in minimizing
labor content. That is not an issue for homebrewing, so take advantage
of that
relaxed constraint, and you can do things the slow (but cost-effective)
way.
Get ahold of a few scrap SMT parts, and practice soldering them to
copperclad
material. Use a small iron, with a small tip, preferably one of the
closed-loop
temperature controlled jobs, but that is not actually essential. A good
light and
magnifier can be handy too, particularly if you are in the bifocal age,
as I am. Use of
small-diameter solder (I use 0.015" diameter) is essential.
Simple PC patterns can be made with a fine marking pen and etchant,
such as the
ferric chloride from Radio Shack. I have even done it with an Exacto
knife only, for
simple patterns. The SOIC package of the 9850 can be connected by
slightly bending
up the pins which do not connect to the ground plane , and connecting
the appropriate
parts to those pins, the 'dead-bug' method.

SMT definitely makes homebrewing tougher, but mainly just in the
soldering skills area.
For the AD9850, an (expensive) solution is to purchase the evaluation
board from National
(about $100). It contains the AD9850 and a parallel interface plus
software which runs on a PC to
run the AD9850. There is at least one and maybe two kits offered which
are a complete
VFO with rotary encoder input, but I cannot recall their names now.

Good luck and 73,
Don, W6JL

I've just completed building my latest project... the BA guys will love this... a tube-type crystal-controlled CW transmitter for 80/40/20m using a 6V6 oscillator and an 807 PA with plug-in coils on 5-prong coil forms for the osc and PA tanks. It looks like it's right out of the 1950s! I painted the front panel with a black wrinkle-finish paint (I can't recall which brand I used and I tossed the empty spray can). Does anyone have any good suggestions on how to label the panel? For the time being, I am using Dymo labels, but they look tacky and don't adhere to the paint very well.

I use DATAK dry transfer lables which I get from a local electronics distributor. They are essentially a paint which transfers to the metal when you rub on the paper backing. After putting on the labels I spray the whole panel with Krylon clear plastic coat.

I agree with your basic idea of a higher VCO. I would suggest a lot
higher, say over 200 MHz and mix it with an XTAL based one. This is the
basis of a sweep generator that I have and it does it without too many
complicated circuit elements. The higher you can make the VCO the less
tracking you will require and the easier it will be to remove the
harmonics with a balanced mixer and simple filters following it.

Source record: 80471

I know that there is someone out there who has modified a 49Mhz Radio Shack Walkie talkie.
The model I have is a pair of TRC-506 headset vox/ptt, one channel, and of course its on 49.830 Mhz. I got them for the kids to use bike riding but there are so many baby monitors and cordless phones around here they cant, (use them). I have plenty of xtals in the 37, 10, and 16Mhz range.
In this set, there are 3 xtals at 16.610Mhz, 39.130, and 10.245. Any idea which xtal(s) to change and which pots to realign? Since its a dual conversion, I don't imagine it's as simple as I would like it to be.

I know there are other options, but I'm into these for 70 bucks and would like to give them a chance before I ditch the effort.
Thanks All
Ted Woodzell

Yes, but I don't know how well the transfer labels would work on a wrinkle finish. The last time I labeled a wrinkle finish, you could buy water-release decals that worked beautifully, particularly if you brushed over them with a solvent that dissolved the label's ink directly to the wrinkle paint. Looked like silkscreening, but I haven't seen the decals in years.

You might try looking in your Yellow Pages - a good decalcomania shop can generate most anything digitally.

Paul - Hayward's routine is in HamCalc. You can download at ARRL or QRP-L ftp sites.
Plug in the numbers and it will give a good ballpark start point for a filter. Then sweep it and tweak...

PS - Series cut xtals are best if you get all at once and have them matched, but Parallel resonant xtals work fine too. However, you get the series resonant freq of these which is below the freq marked on the xtal. How low depends on the frequency of the xtals.
If you put lil trimmer caps in series with each xtal, you can move them around quite a bit. This is probably the best way to get them all exactly on the freq you want, as very doubtful odd handful of parallel resonant xtals will be on same freq.
Insertion loss is minimum when you tweak them all onto the same freq.

Good luck...

I have used DX Base and it has been good. I have experimented with LOG EQF since that is what Mark, 8P6JG, uses and I am his QSL manager so getting log info would be easy.....

LOG EQF demos can usually be found on ham BBS systems like Cleveland Hamnet.....

For Sale: Icom IC-T22A

I have a like new Icom IC-T22A 2-Meter HT for sale.
Comes with Book, Shipping Box. Has Mars Mod.

The IC-T22A is 6 mounts old. I bought it for my wife
when she got her Tech License and found she didn't use
it but 3 or 4 times. So am going to sell it and get her
a Dul-Band mobile rig. I paid $239.95 for it and will
sell for,

$175.00 shipped Lower 48

Well, I use LOG-EQF. I think it's the most straight forward program out
there. I looked at about 6 different ones. It imports almost all other
logs including CT logs.

I use CT for contesting and then import the log into EQF.

You can find a demo at: http://www.itis.net/eqf

I also would like to say that when I had questions about the program before
I paid for it, Tom N3EQF answered my emails in about 10 minutes each time.
That was impressive. Good luck

There is a line of similar boards in DigiKey called "surf boards".
Don't know it the 9850 would fit any of them.

The typical Hy-gain and Yaesu rotors will support several hundred pounds
of pure vertical load. Your 40ft of mast and 4 antennas and the
vertical component of the guy load can't be that much.

Hope this helps.

There's a company in Germany that makes what I call surface mount "proto-boards." They have a number of different boards, typically simply the PC pattern for a particular IC etched into copper on one side, and sticky-tape on the other (so that they can be mounted on base-board). I found their catalog (after ALOT of searching) on the web - I was planning to do exactly what you're doing - build a '9850 synth, and I didn't want to drop the money for the AD development board.

These little boards look great. Unfortunately, the name of the company has completely slipped my mind. However, I have the catalog at work, and anyone who's interested can e-mail me at the following address and I'll see if I can dig up the info.

My work e-mail is: janderson@polycom.com

the only info seen was given in DUBUS some 10 years ago that some
Italian amateurs experimented. They used PSK boards, but needs to lock
fast, so G3RUH board will probably be too slow. The Japanese and Italian
versions seems better.

not funny Ed, while it is against the philosophy of an amateur radio
operator to recommend amps to cb requests, it is also against the
philosophy to recommend damage to their equipment or well being. It is
better to educate people to the violation of the law than to become
criminal as well.
Go stand in the corner.

I have the following for sale/trade....

<1>
dx 390 radio shack sw reciever with
box manual ect....almost new works well and no blemishes

$80 +shipping

<2>
mfj 451keyboard keyer with keyboard,
wall adapter, manual, box, keyinput

sells for 99 in the mfj catalog, street retail?

$55 + shipping

<3>
mfj 564 iambic key paddle wired with
a stereo jack to be used with any iambic
keyer to get dits on one paddle and dahs
on the other

$35 +shipping

<4>
IC 22S diode programmable 2 meter radio with mike CORD ONLY
and mobile bracket with conversion paperwork for packet....I got half
way thru packet conversion and came across a ic207h with dedicated
packet port....I don't have the packet crystal needed, but the info is
in the package.....

$35 shipped

<5>
radio shack digital power meter. Works great up to 2m
astatic D104
8 of 10 on condition with new cable.
wired for 4 pin something to ensure that it
worked and it works fine

$30 +shipping

<7>
d104m6 mobile amplified mike
7 volt battery cage broken, you can
get another from astatic for $2.00

no connetor for radio

$30 shipped

<8>
I also have about 2 dozen 4 wire
mike cords. These are the heavy duty
belden cables that I bought surplus cheap!
I will pass the cheap on to you
these normally go for 9.95 each

$3.50 per cable shipped

<9>
old style radio shack amplified mobile mike
with 5 pin din connector
these are GREAT mikes, have been closed out
for some time now, sorry no batterys left

$5.00 shipped

<10>
matched pair of mrf497's I was going to build a radio
with high output but the idea fizzled...***note these are the
high output transistors that are used in the hr2510/hr2600/htx100
high output mods****
I also have a matched pair of mrf492's that I was going
to build into a 6m amp, but am going the route of a
larger output radio.

497mp $55
492mp $55

or I will take partial trades

looking for....

KAM version 7 or later with software/cables
6 meter radio dedicated to 6 meter and allmode

2kw or better tuner with wire/and dual coax outputs
with meters

I can be dealt with, if you have trades, let me know

km5rt@ticnet.com

Pursuant to the same laws that govern the fax spammers,
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, and the time and effort that
it took to kill the OFFENDING message.

If you like CW use it! If not, learn it long enough to make the test then do whatever you want. If you will not be doing CW on the ham bands, 13 WPM is probably fast enough for the test. 20 WPM will only get you 75 khz of space for voice for MUCH time and effort...you weigh the effort to gain ratio...it is YOUR choice If you are licensed, use whatever bands you are allowed to keep the agencies and private companies from trying to steal them.

I am presently active on.
80-10 meters ssb voice and fm where allowed, 6mssb,6mfm, 2mssb,2mfm packet,2mfm simplex,220fm,432ssb,440fm,440fmpacket and whatever I can get my hands on.

The company you looking for is named: Wainright
They have system called "Minimount" which is footprints of most
popular packages with rubber glue on one side and copper on the other.
They do have stripline 25-100 ohm and also special thin pcb for
low-impedance stuff such as DC-power.

Be warned they ar NOT cheap, but easy to use. Anyone can make their
own for a fraction of the cost!

But then you have to put on the glue all by yourselfe.

Cheers

Some 10 years ago an experimen was carried out using PSK-modems and metior scatter. The distance was someting in the order of 1000-1500 km. The set-up was all computer controlled and logging. The two nodes were calling 24 hours a day trying to pass information.

If you are interested in the outcome do contact SM5IXE.

Cheers

"PNP germanium medium power transistor, designed for relay drivers,
pulse amplifiers, and high-current switching applications."

Max:
Vceo = 40 V
Vcb = 60 V
Veb = 20 V
Ic = 3 A continuous
Ib = 1 A continuous
Pd 450 mW @ Ta = 25 deg C
Pd 20 W @ Tc = 25 deg C

Thermal resistance, junction to case 3.75 deg C/W

hfe 33-200 @ Ic=50 Ma, Vce=0.5 V
20-60 @ Ic=1 A, Vce = 0.5 V
18-72 @ Ic=0.5 A, Vce=1.5 V, f = 1.0 kHz
2 min @ Ic=0.5 A, Vce = 1.5 V, f = 112.5 kHz

Don't see an ft spec, but judging by the hfe spec at 112.5 kHz, it's
awfully low.

I have a Motorola GP300 that I have converted for use on the 70cms band. the radio has worked well for a couple of years, but has now developed a fault.

The TX power is now miliwatts instead of the normal setting of 3w. I think the RF power module may have blown. The module is as follows:

MHW 707 -1 (7pin)

The radio is a lowband UHF.

Please can you tell me how to test these modules and also if it is faulty how much are the replacments ? Where can I purchase them from.

73 de Colin in Barcelona.

Would someone please tell me if there is a good Amateur Radio Logging program out there?(time contacted, qsl'ed or not, call sign, etc...all that good stuff)

I have searched the Internet for some and have come up with hundreds of names of logging programs. I would really like to narrow it down to say 5 or so....maybe someone out there has some experience with some good ones?....please let me know.

Thanks in advance. Norm B.

I can be e-mailed at; dragon@wkpowerlink.com

It's Wainwright. The only problem is that their UK distributor has a £50
minimum.

The 1N4007 apparently DOES have the requisite PIN structure. Its' siblings, the 1N400x series does NOT. I have used the 4007 and it seems to work fine in this application that it certainly was not designed for. They do not have the Q of a PIN, but if you have them, try them.

>that appears to be brand new and it appears to be a linear amplifier.

Despite being illegal, CB amplifiers are widely available.

In my experience, they're also downright dangerous!

I was once asked to look at a popular model with thoughts of using it (legally) in the 28MHz ham band with a ham license. The unit had no interlocks or bleeder resistors. It had been unplugged and turned off for over a week, but there was still 100 volts on the plates of the tubes!

Some models may be properly usable in the ham band if you have a license. (and the electronic knowledge to operate them safely!) Without actually seeing the unit, it's kinda hard to answer your questions.

Hi Sergey,

With such a low crystal frequency, you cannot produce a 2730 Hz square wave with the PIC devices. Each instruction cycle takes 4 clock cycles; the instruction cycles therefore run at 8192 Hz. The following program section is the shortest you can use to produce an output on RB0.

```
LOOP bsf PORTB, RB0 ; turns on pin RB0, 1 instruction cycle
bcf PORTB, RB0 ; turns off RB0, 1 instruction cycle
goto LOOP ; takes 2 instruction cycles
```

You can see from above that it takes at least 4 instruction cycles to produce a pulse on PORTB. This will not be a symmetric output; it will either be turned off for 3 cycles and on for 1 cycle (as above), or off for 1 cycle and on for 3 cycles (if you switch the "bsf and "bcf" commands). This is at a frequency of 2048 Hz.

I will throw together a little program to demonstrate the chip initialization and port setup commands and timing to generate a 2730 Hz output with a 1 MHz crystal. This can be easily done and should be very short.

>which xtal(s) to change and which pots to realign? Since its a dual
>conversion, I don't imagine it's as simple as I would like it to be.

I've never seen one, but the numbers look pretty obvious.
16.610 x 3 = 49.830, so the transmitter is probably a simple tripler.
39.130 + 10.7 = 49.830, so this probably sets receive frequency.
10.7 - 10.245 = 455KHz, common IF frequencies, leave this one alone.

GC Electronics used to make decal sets for labeling panels. Now days, you go to your local craft shop for such things. They probably have both the water-decals and the rub-on kind.

I'm curious where you found the plug-in coil forms and the 807? Does the thing transmit in CW that can be copied on modern receivers? I bet you're thinking about finding an old 6L6 AB juke box amplifier so you can get an output transformer to rewind for plate modulation!

Sorry, but this occurs with any diode. Back in 1962, I published an FM modulated phono oscillator in Popular Electronics that used a 500 ma silicon diode made by International Rectifier. If memory serves, we didn't even know what a PIN diode was back then .... they had not invented it yet! Prior to that, we were FM modulating the PN junctions of rush-box oscillators on 6 M with carbon mikes which probably is varied the PN junction capacitance of the transistor.

I'm studying for my General class, and ran across some questions re: reactance. Specifically, one question dealt with a coil and cap in parallel being resonant at a specific frequency when Xl = Xc. Taking it farther, if you vary Xl and Xc, you could create a window where the reactance would be low, creating a bandpass filter. Am I right?

Varactors are normally operated reverse-biased. PIN diodes are
not required to observe the voltage-varying capacitance phenomenon.

The long carrier lifetimes of PIN diodes make them very useful
devices for forward-biased RF switching applications.

I've mentioned this before, but if you read the first article about
Parametric Amplifiers in CQ by Sam Harris (it was in 1958 or 69),
he mentions that the expensive item will be the varactor, which
were relatively new at the time. He came right out and said to
try whatever diode you haveon hand, and once you get it going
with that, then you are ready to spend the Big Bucks on an
actual varactor.

I think that gave a good start to the filed of varactors. Over
the years there have been plenty of articles and comments in articles
about using non-varactor diodes as varactors. The idea being to try what
you have on hand. Sometimes they won't work as well as the real thing,
but according to some people's comments, they have ended up with
better devices. It depends on the application and the varactor
you might otherwise be using.

But remember this warning from one article about a 6M synthesizer in Ham
Radio. If you use a glass diode that you can see into, be sure to paint
it over or otherwise cover it up, or else you may find it being modulated
by a nearby AC lamp at 50Hz.

I forgot to mention -- check the datecode on the labels before you buy - these dry transfer labels have a finite shelf life and the manufacturer won't guarantee transferability longer than five years at room temperature storage. You can pre-release old labels by lightly rubbing onto the original backing sheet, then transferring to your work. I have some dry transfer stuff that's almost 25 years old; some will transfer, some won't. You can recognize the datecode by a four digit field; e.g., 9411 = 11th workweek of 1994.

replies from UK only please

All this stuff is for the 8051 and variants,
3 large size ring binders containing about 250-300 articles
about programming, code and hardware.

Two programmers, one Stag and one home built from Atmel app note.

2 working Eurocard boards one Arcom the other home built.

A few chips AT1051, AT8951, 8052 BASIC.

At least 15 data books and application manuals, Intel, Philips, Dallas.

Looking for about 100 pounds ono plus p&p

> recommended circuit(s), please let me know.

See http://www.afthd.tu-darmstadt.de/~dl2zbn/70_breit/70cm_him.htm for ideas about 70cm PAs. It is written in German, but the schematics are more or less self explanatory and I am shure the author will be happy to help You (I do not know him personally, I just found his homepage some time ago). They do work with 12V, though, but I doubt You will be able to get more than 1-2W from a 5V supply.

> Also, do you have any recommended TX/RX switch to handle this
> power? The transciver chip's RF TX out and RF RX in are tied together
> to use a common antenna.

They are actually not tied together. You can use a separate RX and TX path.
Quite practical for the PAs mentioned above.

I am desperate for a schematic for a programming cable for the Maxon SL500 portable. I have several for my FD, but the seller programmed them wrong and won't help. I have the software and a cable with a crushed end, and need to rewire it. Any help would be GREATLY appreciated. The number is either an SMP 4004 or 4005. One is for the SL500, and the other is for the rest of their portables. THanks Jeff WA1VQY@EFORTRESS.COM

Right, I believe the idea behind using a PIN-type diode as a
varactor is that the PIN diode won't conduct under RF forward
bias and degrade the Q of the resonator. I suppose the variation
in capacitance under RF bias is also smaller.

However, I believe, by the very nature of a PIN diode, the reverse-
biased capacitance of the diode will be quite small, and the
capacitance ratio very small.

It is easier to avoid the forward-bias issue by using a pair
of back-to-back varactors, the Motorola MV104 is pretty good
for this.

1235. Re: Ham amateur pilot programs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-13 00:00:00 UTC
From: Tovar <tvr@nospam.THEOS-software.com>
Message-ID: <87u33g1z2p.fsf@TVR-LINUX.THEOS-Software.Com>
Source record: 80420
Cross-posted to: comp.sys.palmtops.pilot,rec.radio.amateur.homebrew

Right now, i'm looking for a pre-built Pilot GCC for the current Debian
LINUX, as i don't have enough disk space handy right now to completely
recreate GCC, as the documention instructs.
[26 Jul 1998]

OK, amateurs and Debian folk, there's now a set of pre-built packages
for LINUX at 'ftp.debian.org', to be found under 'dists/unstable/main'
(or the corresponding place at one of its mirrors) which provide the
Pilot GCC development environment in a pre-compiled form. You can just
pick up the Pilot stuff without downloading the other beta versions and
then remove 'unstable/main' when you're done getting the pilot stuff
if you don't want to run the betas of other parts of that LINUX.

With that, i succeeded in compiling and running 'doodle', but 'smorse'
was missing a source file ('tab.c') so i didn't get a chance to try
that one. But 'doodle', 'though trivial, might prove vaguely useful
for logging rapidly (such as during AO-27 satellite passes) where one
does not have time to correct 'graffiti' errors (which are 'deadly' on
callsigns)... (I suppose an analog tape recorder may actually be the
better tool for the job.) So at least it's a start and we'll just
have to wait and what us homebrewers come up with.

Recently acquired an inoperative 1970's GR model 1608A LCR Impedance Bridge. Would like to purchase information on this test equiptment. General Radio sold off its test equiptment line to Quad. Quad doesn't have any info on old equiptment (they want to sell new ones). And several websites on old test equiptment does not list this model. I believe the only thing wrong is in the power supply. Not much else could go wrong unless some drastic overloads took place. No burn't parts. Very clean inside.

Nope, using a hall-effect sensor requires a sizable magnet! You wouldn't
want that around floppy disks! The sensors with the slot in them are
optosensors. All the sensors on a floppy are either opto or switches,
except for the 3.5" which have a hall-effect or coil sensor for an index
sensor on their bottom flywheeel, with a tiny magnet in the wheel.
The 5.25" don't have them! Their speed doesn't have to be that precise.

Hall effect sensors seems to be quite expensive on this part of the globe, somewhere about $20.- +VAT($4.-) one off.

Some older 5.25" floppy drives seems to have some components looking like hall-effect sensors (4-pin case), are they supposed to be linear or digital?

The ones used as rotation speed sensors in disc drives are digital. What is it you want? Some inexpensive ones used to be made by Sprague, now taken over by Allegro. The linear sensors are less than a dollar in quantitity. If you just need a couple, maybe I could get you some samples. Drop me some E-Mail.

All of the Hall sensors that I have removed from dead disk
drives, both 5.25 and 3.5 inch, have been simple linear Hall bridges
with no active electronics in the package. A quick check with an ohm
meter will confirm what type of device you have. If it's just a
bridge, there won't be any difference in ohm meter readings when you
swap the polarity of the probes.

Jim

1254. Which type resistor?

1. I need generate 2730Hz , using X-TAL 10MHz.
How i can do it, may be isung interrup or else?
Please create asm file for MPASM, simple i'm novice in programming PICs

2. and yet, i'm using PSIM (simulator for PIC) and PSIM have
labels:

LATCH PIN TRI-STATE
PORT A 1F 00011111 00 00000000 1F 00011111
PORT B FF 11111111 00 00000000 FF 11111111

What is LATCH?
What is PIN?
What is TRI-STATE?

3. Anyone know graphic simulator for PIC,
i want see wave, and see ms,us , and know frequency.

1256. Re: Logging program for Amateur Radio?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-14 00:00:00 UTC
From: kf6eal@nospam.compuserve.com
Message-ID: <09980714075524.OUI05.kf6eal@nospam.compuserve.com>
Source record: 80351

I am finishing up a windows (will be available in 16-bit and 32-bit versions) logging program that I decided to write after downloading another popular windows program and being disappointed by how clumsey it was to use.

The program was modeled after a spiral bound log book and is very simple and straight-forward. The initial version will not have any hardware interfaces (all manual input) and no file import feature (for taking data from one program to another).

When it is ready, I would be gald to share it if anyone is interested.

Source record: 80353

I was having trouble with my radio programming from the ADMS-1C and I figured it was software so I order the upgrade to ADMS-1D. Now my FT-50 radio seems to be in some mode where it will only let me transmit from 144 to 146 (haven't even looked at the 440 side). Isn't that the 2m amateur band in Europe?

Anyway, does any one know how to get out of this? I have tried holdin the knob, monitor, and power button to reset but it didn't help. Thanks.

There is a better way of doing what you want to do AND it's 100% legal . . .

Please consider getting a Ham Radio License. There is a class of license called the TECH. or "No Code" license. You don't have learn the morse code (unless you want to upgrade). You do have to learn some rules of proper operation and some basic technical things. However, it's not hard to learn; my son was able to learn this and he got his license when he was 11 years of age.

Ham Radio is different than CB; while we have our colection of Bozos and Jerks, most of the Hams are frindly and helpful. The Ham who's considerate of others and friendly will be accepted by the group. The Ham who's rude or cuts others off, will be consider a "lid" (Bozo) or a Jammer and be rejected by the group.

Unlike CB, Ham Radio can use a Repeater. In general, a Repeater sits in a high place, like at the top of a building, hill or mountian and relays your radio signal from one frequency to another. Thus, Hams transmit on one input frequency and receive on another. As a result, we can obtain greater range than by stright symplex. In fact, in many cases, we don't need a lot of power to get a lot of range. While the range depends on the area around you, it's not hard for me to go 40 to 100 miles from a repeater and still be able to communicate with others. Using a small hand held unit, I can have my radio with me even when I'm on foot. By using the right repeater, I can be in tough anywhere in town.

How much do I pay for the use of these repeaters? NOTHING!
Still, because Ham Radio is based on sharing, so while I'm not required to pay, I do help support the clubs that sponser there repeaters.

To find out more about Ham Radio, please check out this WEB Page:

http://www.arrl.org/

Best Wishes,

Bob

J.-M. Noeding wrote :

>>>I have recently become interested in a schematic that calls for a KANK 33
>>>coil (a transformer actually) Does anyone have any info on this type of
coil?.

Toko 10K inductors are available from from Cirkit in the UK.

KANK3333, 45 MicroHenries, 55T primary, with tap at 14T,
4T secondary

KANK3334, 5.5 MicroHenries, 18T primary, with tap at 7T,
3T secondary

KANK3335, 1.2 MicroHenries, 8T primary, with tap at 4T,
2T secondary

If you have a steady hand and a keen eye, it's not too difficult to wind
your own 10K coils.
Dead cb radio's are a good source of toko coils. Remove the old windings
and replace them with your own.

Jim OM,
No, it is not illegal to POSSESS a CB amplifier. It is only illegal
to sell or USE it as a CB rig. You can modify/use it legally on the ham
bands as long as you are an appropriately licensed amateur radio
operator.

Hello radio amateur freaks

Does anyone know about a sound card based packet radio system for radio amateurs (X.25 via 1200 baud and/or 9600)? I have heared about a system called PcFlex, but can't find anything about it on the internet - is it a real program?

Yours faithfully

Jim:
Never be ashanmed of a bargin !
Find youself a local radio club and / or head to Radio Shack or HRO
and pick up the materials for a Tech Plus License.
Get on 10 meters. I work all over the country and sometimes out of it
with a little RS HTX 100 25 watt unit in the car with a mag mount
antenna.
Throw that amp behind a rig,run it up to 100 watts or whatever is
minimum to maintain a contact, and you will talk to world , meet a lot
of really nice people, and have yet another hobby to dump cash into !
:-) !

If I can give you a hand in the ham direction, drop me a note.

73 de KA9AHQ/7 Novice since 76 !!!!!!

Ummm, the 50 Mhz conversion you are suggesting is in the ham 6M
band, so Ted will require a ham license to operate any radio
modified in this manner. You licensed, Ted?

What does the FAA say about it? I'm sure it would have to be type
accepted as well.

Just about any power supply that has the right voltage, or is
adjustable, will do.

I've been maintaining my batteries on float with a simple
supply built around an LM317 for years.

HMMMMMM,

In runs in my mind that if you are in possession of an amplifier that is operational on 27MHz and also operate CB equipment it will be assumed that you use it, Thus possession is illegal. Could be wrong been a day or two since I had seen a copy of P95.

It will xmit on cb after doing the mod on am/ssb/cw
or any other frequencies for that matter
<careful!!>

Pursuant to the same laws that govern the fax spammers,
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, and the time and effort that
it took to kill the OFFENDING message.

If you like CW use it! If not, learn it long enough to make the
test then do whatever you want. If you will not be doing CW on
the ham bands, 13 WPM is probably fast enough for the test. 20
WPM will only get you 75 khz of space for voice for MUCH time and
effort...you weigh the effort to gain ratio...it is YOUR choice
If you are licensed, use whatever bands you are allowed to keep
the agencies and private companies from trying to steal them.

I am presently active on.
80-10 meters ssb voice and fm where allowed, 6mssb,6mfm,
2mssb,2mfm packet,2mfm simplex,220fm,432ssb,440fm,440fmpacket
and whatever I can get my hands on.

Need some ideas about how to filter out my transmission signal from my home entertainment system. I am running a fairly new Kenwood at about 80 w through a matcher into an R7 vertical. I have a rather extensive sound system for my DDS TV with most of the wiring in the basement. (Also the location of my shack) All?? of the speaker feed wire is shielded, twisted pair, with one end grounded. My rig is grounded to an 8' ground rod just outside the basement wall. When I transmit I get rumbling in the sound system. Not there with the sound system powered down, so I don't think it is direct coupling into the speaker wire. Where should I try to filter and which direction should I try - bandpass, low pass, high pass etc.

Any thoughts will be very welcome. Doesn't bother me (can't hear it) but, it seems to upset the XYL just a bit when she is trying to work upstairs. And as we all know, a happy XYL makes for less discussion when we want that new piece of gear.

Thanks is advance

Denny - K4KFZ - Virginia

> The 5.25" don't have them! Their speed doesn't have to be that precise.

About 6 months ago I took a crashed hard disk apart to see if it
was mendable. There was a hell of a permanent-magnet field in
there, it seemed to be associated with the r/w heads. Have still
not figured out why. A few speculations.....

1. Years ago on magnetic tape recorders ISTR that it was not
enough to simply put current into the Write Head. Low level
magnetic stiction required an hf cycling of the tape at the
same time... called 'bias'. Cheap recorders would do this
with a permanent magnet bias. I wondered whether this was
still being done in hard disks.

2. It was noticeable that when the heads were parked they were
handily held in place by the magnetic field.

3. If a permanent magnet is already in there for recording reasons
then detection of the r/w head by a Hall Sensor could make sense.

I would try ferrite cores on the speaker leads as close to the
amplifier as possible. My guess is it *is* coupling to the shield of
the speaker wire, and getting into the amplifier that way. It may be
then conducted to a lower-power stage before being rectified.

Really, any cable entering the amplifier (don't forget the AC power
cord!) is a possible entry point for RF. Indeed, if cores on the
speaker leads don't help, the AC power is the next thing I'd try.

The magnetic field was probably from the rotary actuator. It needs very
strong fields to give fast access during seeks.

It is a big problem to keep the leakage away from the R/W heads.

Any stray field, even as stong as the Earth's field, will bias the R/W
core and add asymmetry to the read signals. This reduces timing margins
and can lead to read data errors.

I make an instrument called a "Phase Margin Analyzer", that meaures the
read timing margins. It is sensitive enough to detect the difference in

read performance when the heads are aligned with the Earth's magnetic field, or perpendicular to it. (You need not worry - the difference is small!)

Also, any permanent field entering the R/W core will bias the heads during a write operation. This offsets the position of write transitions and creates a permanent error in their location.

It is a marvel how they manage to generate such strong fields needed for the rotary actuator, yet keep the leakage field away from the R/W heads.

Best Regards,

Mike

The speaker leads, power leads, are acting as a long wire antenna. Where is the shield grounded? It should be tied to the metal chassis of the receiver.
The suggesting for putting split ferrites on the speakers just before they connect
to the receiver is a good one. You may also have to add some .01 bypass caps
from the speaker connectors on the Rx to the chassis to improve filtering. You
can also add the split ferrites (Radio Shack has them) to any interconnecting
audio cables, power leads, etc.

Good luck

Pete

(PS: Haven't fired up my KW since I installed the satellite and Dolby surround
sound. Now, I am nervous! Hi.)

Not true. CB amplifiers cannot legally be manufactured commercially, and
they cannot legally be sold commercially, but an amateur can legally modify
one for use on an amateur band. See 97.315(a).

Most of the time, I agree with you. But this time you're off
base.

The spindle motors in disk drives have *BIG* magnets in them
and the newer ones are 3-phase with 3 Hall effect devices inside for
commutating the drive currents.

The magnetic coating on a disk is driven to saturation when
the data is written. The term "Saturation" means that the maximum
change has occured and no small field will be able to add or subtract
from that value.

Leakage fields have no effect on disk drives until the field
becomes as strong as the field that the R/W head generates. The field
from the head is very strong because the head is very close to the
surface of the disk and because the field is concentrated into a very
small spot.

Hello everyone,
I have the great pleasure to say to all of you that I give birth to a new baby.
It weight about 15 pounds and mesure 0 to 40 volts. He can cry about 5 amp (there are some more tests to verify that). Most of it come from old

computer, UPS and VCR. He is still naked (no box) but I have an old UPS waiting to be emptyed. I am looking for a nice name for him. My wife said I could name it "Godzilla". Well, he is not that big (5"x 12"x14") and not so ugly :-)
When the baby will be an adult he will have full digital meters on amps and volts. ICL7106 seem a reasonnable choice for meters. Not very expensive and seem simple to use.
BUT...I soon discover that each module need there own power +/- supply!!!
Do I really need to build two double (+/-) supply for those meters?
I still have some more reading to do in the appnote of Harris Semiconductor but If any one of you had used the ICL7106 for meters or if you know any links just send me a short note about it.
Tks for reading

JeanJ
A happy father

1310. Help - SMD cap identification

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-15 00:00:00 UTC
From: hcdmshaloam@eritter.net
Message-ID: <35D5F671.67B5@eritter.net>
Source record: 80309

I was working on adding a few loops to the AM loop antenna (this coil would be connected to two screws on the case going to an external antenna with one of the ends of the loop also going to the ground of the radio) of a Radio Shack DX 390 [Sangean 818]. As I was finishing up and screwing down on the case, one of the board screws was accidentally placed in a screw hole for the case - the result was screwing down on top of (and the crushing there of) a surface mount capacitor (instead of neatly screwing down into the hole where it belonged).

Here's what I could use help with -

These surface mount capacitors (1mmx2mm) don't have enough room to show the value of the capacitor. This capacitor was not a "white" one, nor was it "dark brown" - it was more "tan/brown" in color. How can I best determine the actual value of the capacitor so I can acquire a suitable replacement?

If you have a Sangean 818 or R/S DX 390 with the back of the radio off, and the bottom of the radio facing you, the capacitor is located on the top left hand side of the radio near the screw hole - between the screw hole and the metal shielding plate.

One side of the capacitor goes to ground - the other side to who knows what?

When I pressed the power button - the radio would not turn on - it wouldn't do anything else either - the clock was stuck on 13:16 also. I suspect that the capacitor may have shorted out whatever circuit it was connected to with the ground on the other side of the capacitor.

I've removed the capacitor, but I haven't tried turning the radio on yet to see if it works.

My best guess is that it was merely a 0.1 mF capacitor acting as some sort of "filter" capacitor for a digital circuit, or maybe even dealing with power. With it shorted to ground, there was not enough power available to the processor to kick in when the power button was pushed.

Any other comments or recommendations are appreciated -

73,
Daniel

There is nothing gentlemanly about your carrying on about a transmission mode that has many adherants around the world.

If you want to promote the many benefits CW/AM/FM/digital mode activity in the Amateur Service, go ahead - amateur radio will be the better for it.

On the other hand, if all you want to do is complain about SSB (which many people enjoy) and do nothing positive about promoting the other modes, then you should seriously think about handing in your amateur licence - we have enough whingers and knockers without you contributing to the melee.

Some people enjoy SSB. Anything you say or do will not change this one iota. Get a life and do something positive!

Before you assume that the module is faulty, check the current drain (keyed) of the unit. If you see more than 1 Amp, the module is probably still alive. In this case, the problem is usually caused by the little spring contact that connects the antenna socket to the board. It will get bent (I'm still trying to figure out how!) and will either short out to the metal case casting (which unfortunately rarely does blow the module) or will fail to line up with the contact. I usually replace them, but you can actually just bend it back into position. There is a little fork on the loose end which MUST engage with a tang on the base of the spring for this contact to work correctly.

If you do determine that you need to replace the Module or need schematics, etc. Please E-mail me and I will get the Motorola part #'s for you. You should be able to purchase them from any local Motorola repair shop.

Murch Electronics Model UT-2000-A (See July 1970 QST article, by Lewis McCoy). - THE ULTIMATE TRANSMATCH - Continuous coverage 10 through 80 meters (actually general coverage from 3.2 mHz to 33.1 mHz using rotary inductor and turns counter). Condition: Appearance is like new, shows very minor usage .... at present the pop out spinner on the rotary knob is misplaced but I will find it. Operation has been tested to max legal output using a pair of 4-1000A's on all bands. COST is 110.00 USD plus shipping via UPS (weight is 8.5 pounds). Payment by money order or certified check shipped same day .... Personal checks must clear first (sorry but I have been burned before). Contact me by my EMail if you are interested .... Thank you es 73!

It's virtually impossible to tell the value of a chip cap by looking
at it.
Color doesn't mean anything. The same value from different sources
may be a different color, too.

That's possible, but it's anybody's guess unless you have a schematic
and can figure out exactly which cap it was by doing a bit of simple
circuit tracing. Otherwise, I'm afraid you are "screwed," as they

say.

>Any other comments or recommendations are appreciated -

Have you checked to see if the manufacturer has a presence on
the www? If so, you may be able to e-mail a description of your
problem
and which cap it is to them and have them send you the right part to
replace the broken one.

Otherwise, unless if you can determine that it's just a simple bypass
you could try something that you guess would be an appropriate
value and see if it works. Guessing at "the right value" would
involve
some knowledge of the function of the circuit, of course.

Good luck,

Source record: 80322

snafu:

This may sound dumb, but I use MS Word and the stick-on clear labels (or whole sheets) with a regular ink-jet printer. The ink doesn't rub off like you'd expect, though I haven't really got in there and rubbed any hard. Put the plastic over the entire panel - do the whole thing at once. Looks nice, but it's tough to change any lettering or graphics.

Whatever works. 73 de Lance W9EMI

Most of the amateur radio newsgroups are gatewayed to mailing lists.
Instead of using browser or newsreader software and connecting to a
Usenet news server, the messages from the group are emailed to accounts
registered in the list servers subscriber list, and any replies to the
list server account are posted to the group.

Sometimes it doesn't work too well, and one of the computers involved
posts stuff like email that was bounced back.

1325. kenwood TK-730/TK-760 programming???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-15 00:00:00 UTC
From: unlisted <unlisted@number.com>
Message-ID: <6r5s1vaqn1@legends.cet.com>
Source record: 80324

I have a TK-730, the programming software and the factory programming cable... Am guessing that they will also program the TK-760 radio's??? Does anybody know for sure if this is so and if so do you know how to put the 760 into program mode? I have no problem with the 730 but the buttons are different and the 730 doesn't seem to want to go into program mode.

If not any idea where one could find some software to program the 760's???

Thanks a bunch

Roger@alumbaugh.com

1326. hamfest/computers Buffalo, NY 8/23

The Greater Buffalo Hamfest and Computer Show is comming up next Sunday August 23 at the Hearthstone Manor in Depew, NY.

This event is sponsored by the Lancaster ARC with the cooperation and assistance of several othe Amateur Radio Clubs. It will be the Amateur

Radio and computer EVENT OF THE YEAR for the Western New York Region.

There are still some indoor vendor spaces available so please contact Bruce KG2IC at 716 625 8800 to make your reservation.

The following is a brief description of the show which is located near the intersection of Walden Ave. and Dick Rd.

Time: 6:00am to 3:pm for outdoor, Indoor starts at 8:00am

Over 3 acres of outside fleamarket area

13,000 sq. ft of inside Vendor space

Food, VE exams, free parking

Easy to get to, Right off NYS Thruway I-90

Prize Drawings every 1/2 hour

Inside Hall opens at 8:00am

Talk-in 147.255+

Check In Prize

Tables available

Tailgating spaces are FREE

THIS HAMFEST WILL BE HELD RAIN OR SHINE. THERE IS A LOT OF INDOOR SPACE!!!

FOR MORE INFORMATION, PLEASE CLICK ON:

David
I thought this chip was only available in SSOP which is SMALL (0.65mm pin spacing)
I dont think I can hand solder reliably at this spacing If there is a SOIC package this would be helpful. Anyone got any info?

VK6BRO
This may not be the appropriate group for this post but the best
homebrewers semm to be here!
I have used the PIC for a number of projects bur I looking for a system
with better capabilities. The AVR controllers look good but I am looking
for a cheap! system with a compiler (?C) and sotware for a programmer.
According to app notes from Atmel a simple in circuit programmer can be
made using an AT90S1200 and a few components
Anyone know of:

(1) A net source of AVR micros 90S1200, 4414, 8515

(2) A C compiler

(3) A simple programming solution

(4) A more appropriate newsgroup if such exists

Thanks

Richard

Radio shack has or can order service manuals for all the radios it sells. My advice would be to get one. They are reasonable and can be of great help in future problems, if you plan on keeping your radio a long time. Or, make friends with their local tech, and maybe he'll let you peek at the manual. Worked for me a couple times. Once they called the distributer and had them fax me a single page so I could ID the part and order it. Good luck.

1332. Maritime radar detection

My boss wants me to make a cheap box to detect maritime radar for his
little yatch.
normally I don't "do" rf stuff, too dificult for me, but as i
understand it you just use a rf diode as a detector and then normal
low bandwith analog stuff

can anyone point me to a web site or tell me a suitable diode to use

thanks

Sure, near the motor disk magnet that's fine, but I believe the original
poster had mistook the optosensors for the 5.25" write protect slot and
the index hole for hall-effect!! That would NOT be a good idea!! ;->
-Steve
P.S., That motor disk magnet is magnetized across its face, so the field
is low up toward the floppy!

Great idea .... I have always thought sending out only one side band with no carrier a stupid way to do it.

While we're at it, lets limit CW speed to 5 wpm or less to reduce bandwith on 40 and 20 M. Should be able to squeeze in a few more Advanced Modulation stations that way.

I need to wind some coils which are up in the milli henry range, does the coil have to be wound in a pattern like you see with some of the pi-wound coils that look like they came off a spinning reel or can you simply wind the wire back and fourth with no regard to the pattern?

These coils are used in the front end of a 160m receiver.

Hello everyone,
I have the great pleasure to say to all of you that I give birth to a new baby.
It weight about 15 pounds and mesure 0 to 40 volts. He can cry about 5 amp (there are some more tests to verify that). Most of it come from old

computer, UPS and VCR. He is still naked (no box) but I have an old UPS waiting to be emptyed. I am looking for a nice name for him. My wife said I could name it "Godzilla". Well, he is not that big (5"x 12"x14") and not so ugly :-)
When the baby will be an adult he will have full digital meters on amps and volts. ICL7106 seem a reasonnable choice for meters. Not very expensive and seem simple to use.
BUT...I soon discover that each module need there own power +/- supply!!!
Do I really need to build two double (+/-) supply for those meters?
I still have some more reading to do in the appnote of Harris Semiconductor but If any one of you had used the ICL7106 for meters or if you know any links just send me a short note about it.
Tks for reading

JeanJ
A happy father

PS:. #1 Dont send me cigar, I dont smoke.
#2 Send me a personnal message. I dont have time to read every message of the newsgroup. I am working for my new familly.

Are you sure about this? I would think there would be substantial coupling between the coils. If there was no mutual coupling, your statement would be true. Halving a coil winding does not halve the inductance.

If they are used for decoupling it will make little difference. The
windings you see are designed for minimal capacitance between
adjacent turns.

1353. FT vs T Toroids

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-16 00:00:00 UTC
From: Tim Hynde <ka8ddz@hotmail.com>
Message-ID: <01bdc956$4a62c7c0$15dac2d0@hynde>
Source record: 80252

As long as a toroid is used in the freq's it was designed for can I use
something like an T-50-2 where the specs may be calling for an FT series?
Assuming I change the # of windings to create the same inductance?
Im guessing the FT series simply provides more inductance for less turns
where higher inductance is needed as opposed to a thinner wire on a T
series?

This is being used as an RF choke in series with the 12v supply to a 1 watt
final.
The specific schematic is the Little Joe QRP xmit circuit in the QRP
classics book.

The T indicates powdered iron, and FT ferrite. These are quite different materials, each with its own properties. Among the differences which are generally (but not always) true:

Powdered iron has a much lower temperature coefficient
Powdered iron has much lower permeability
Powdered iron is much more resistant to saturation

Even substituting one kind of powdered iron for another or one type of ferrite for another can result in an inductor not working as designed. Substituting powdered iron for ferrite or the other way around is even more likely to result in poor or bad performance. Also, when low-frequency ferrites (such as FT--43 and FT--7x) are used in RF transformers, the designer may be depending on the ferrite having an essentially resistive impedance over a very wide frequency range. High frequency ferrites (such as FT--6x) and the most common powdered irons (types 2 and 6) don't have this characteristic so are very unlikely to work properly.

The resistive properties of low frequency ferrites at HF are also used to advantage for EMI suppression. Substituting powdered iron or high-frequency ferrites in these applications is also not a good idea.

I can't find the Little Joe in my QRP Classics book, but I think they revised it since I got my copy. The problem you're likely to encounter by using a T-50-2 core for an RF choke is that it's likely to be self-resonant at a lower frequency than you're operating at. This can cause stability problems as well as possible decreased efficiency. If you do need to use a T-50-2, I'd use the minimum amount of inductance I could get away with (enough for a reactance of maybe 200-250 ohms for a QRP transmitter), then adjust the output matching network components as necessary to compensate.

>
>These coils are used in the front end of a 160m receiver.

So-called scramble winding is best, to minimise the capacitance. I
recently experimented with a Philips ferrite pot core, and got 3.4 mH
with a relatively few turns. They have ferrite screw adjusters that give
about a 10% variation, which is useful for audio filters.

Winding the bobbins is a bit tedious, so I was thinking of making a
small mandrel to hold them, and rotating the bobbin in the chuck on my
little Sherline milling machine.

Its almost always used to describe the fields
within a parallel guiding structure like a
coax or a pair of wires. It stands for
"transverse electric and magnetic". It means
that both the electric field and magnetic
field are at right angles to the long
axis of the guiding structure.

TEM modes can only exits in guiding structures that
have perfect conductors, but ordinary conductors
are often good enough, that the field
is just assumed to be TEM anyway.

You did not mention what kind of wire you would be using, but years ago it was a very fine flexible wire called Litz Wire that worked very well for pi-type windings. The wire was coated with beeswax as it was wound on the pi so it would cling tightly in place.

If you are using this type of wire, you might wind the coil between two washers (removable?) held in place on the form by beeswax or other easily removed cement. Generally, as I remember, the best way was to place the form on a rotating mandrel and feed the wire on from the storage spool.

Better be careful there - I understand it's possible to destroy your
audio equipment by adding the bypass caps - apparently it can send
some into a self-oscillation that will tear things up.

I suggest the original poster get a copy of the ARRL's "RFI: How to
find it and fix it" - lots of great suggestions for troubleshooting
and solving the problem.

Easiest thing to do is simplify the system - disconnect *everything*
and listen through headphones - if you still hear it, source is
probably the AC wiring; try a brute-force line filter.

Then start adding things one by one (speakers first) until the problem
returns. Last thing you added is the most likely source. Ferrites on
the leads will usually help.

If you have a powered subwoofer (and I'll bet you do), I would suspect
it as a source - I have one that causes all kinds of problems when I
transmit on 2 meters, 40 and 75. Haven't bothered figuring out why; I
simply unplug it when it's acting up and the problem goes away.

Hmm, could be quite expensive with the AD9850... Use cheap logic ICs for excercising.

> Could also use desoldering braid remove any shorts?

Yes, but again, user solder flux. It lowers the melting point and cleans the solder.

I think there would be a problem using the PC... Specifically, how
would you get the amplitude data from the log amp INTO the PC anywhere near
realtime ??

That's a lot of data occuring quickly, when you consider the PC needs
both the X and Y information for each point on the screen.

Of course, you could slow down the sweep time, but you lose some
performance that way.

If you use a dedicated interface board, you could probably get the
performance, but that drives up the cost/complexity of the system.

It adjusts the bias of course! It is only effective in transmit. Remember from the RAE, that
valves use a bias voltage on the grid to control the current through the device. For a 4CX350 this is a negative voltage of 20-30V. On receive it is more like -90V. All explained in the circuit diagram.

I use HyperLog and there are no problems in doing what you want.
You just set the correct offset between your local time and UTC, then the
program will log the QSO's with the time you want.

From: Robert Fanfant <fanfant@ix.netcom.com>
Message-ID: <6r9mct$su6@news.microsoft.com>
Source record: 80187

My transceiver puts out a minimum of 9 watts. I need to drive an amp that only requires 100 milliwatts. Impedance needs to be 50 ohms input/output.

Does any one have recommendations on building/buying an attenuator that will do the job? Any schematics available? What are the advantages/disadvantages of Pi,T and H pad designs?

Would like 8 watts in for 100 milliwatts out, 16 watts in for 200 milliwatts out. Maximum drive would be about 30 watts.

You can use the 7106 on a single 5 Volt supply by tying
Common to V-. The internal reference regulator won't work
in this configuration, so you'll need to supply your own Vref
from an LT1009 or something similar. The current meter will
need its supply to be isolated so that the whole meter can
float at output voltage.

With my tongue firmly in cheek, I ask......

Are you suggesting that by adding questions regarding bio-chemistry, macroeconomics and perhaps even Thai cooking, people would be have even more to be "proud over?" Of course, your whole argument is a red herring, for people who become interested in ham radio to the point of buying a book and taking the novice or Technician test are probably self-starters anyway, fueled by their interest in learning, quite apart from receiving a wall decoration from the FCC. But you miss the heart of the argument.

I am new to the hobby, having received my Technician license several months ago. The book I studied was "Now You're Talking" by the ARRL. In the book they go to great lengths about how the ham radio enthusiasts are on the forefront of technology, now getting involved with slow scan TV and bouncing signals off of the moon, and the like. What you seem to be saying is that you encourage all of this experimentation on the frontiers of science, but only by those that can speak the arcane ham language of Morse code. But you see, sir, those of us who wish to participate on the frontiers of science don't wish to master the technology of yesteryear.....semaphore flags, smoke signals, or hieroglyphics. I regard Morse code to be just as useless as these, or Latin and Farci as well. I don't mind if you want to use it... but don't force it on me.

In addition, technology has passed the "day of the paddle" by. Now I can hook my computer to an HF rig and type my messages, and let the computer "learn" CW.
>
> 20 years ago I friend said: OK lets have 12 or 16 wpm code test, but
> if someone is smart enough to construct a CW decoding machine (pre-PC
> era) then let them try it! A person that is this smart is "well-worth"
> to belong in the ham-ranks.

Again, another red herring. Should people be required to know how to make their own aspirin, before being allowed to take some? Personally, I really admire those people who can make their own equipment. But my personal interests lie in how radio waves travel, not how the equipment is assembled. Is there no room in the hobby for people like me?

>
> For me the challenge to learn more, upgrade to next level was exciting
> and FUN, not just an obstacle to get over. I wish there were more
> levels, as this is a great way to improve one's knowledge!

You don't need more levels to increase your knowledge. Read the monthly
mags, get out and do some experiments on your own! Or pass what you have
learned on to new people in the hobby, by joining a club and helping the
newbies.

>: educational purposes only of course. I bought at a flea maket a unit
>: that appears to be brand new and it appears to be a linear amplifier.
>
>YEP, it's a linear amp.

I once worked in an electronics repair shop. We used to get all sorts of these weird brands of CB amps in for repair. Most of them were of really poor design; they usually ran the transistors in Class C (not what I'd call "linear".) The spectral output was atrocious. I'd call them "TVI/RFI generators", not "linear amps".

Consider a REAL linear amplifier such as the Motorola AN-762 design. This is one of the best - a clean 140 watts out for about 5 watts in from 3.5 through 30 MHz. I use one once in a while with a 40 meter QRP rig if I need a boost.

T-Pad for 9 watts to 100 mw is....50 ohms Z in/out

```
---R1----------R3------
|
|
R2
|
|
```

R1=40.5 ohms at 7.3 watts
R2=10.7 ohms at 1.5 watts
R3=40.5 ohms at .1 watts

: the value of the capacitor. This capacitor was not a "white" one, nor
: was it "dark brown" - it was more "tan/brown" in color. How can I best
: determine the actual value of the capacitor so I can acquire a suitable
: replacement?

Though many SMT caps don't have any marking, if you see one with three digits (and can actually read them), expect a letter, a letter, and a number. The first letter should be a manufacturer code. The second is the value: A = 1.0, B = 1.1, C = 1.2, ... G = 1.8, ... L = 2.7, ... S = 4.7, ... W = 6.8, Z = 9.1. In other words, omit I and O and assign the remaining 24 letters to the E24 series of values. The final digit is the power-of-ten multiplier, for a value in pF. So: KA5 is a Kemet 0.1uF cap, and KN3 is a Kemet 3.3nF cap.

(Sounds like the original poster doesn't have a marked cap, but this info may help others just getting started in SMT.)

kiminy@courier net.infi.net wrote:

: I'm studying for my General class, and ran across some
: questions re: reactance. Specifically, one question dealt with a coil
: and cap in parallel being resonant at a specific frequency when Xl =
: Xc. Taking it farther, if you vary Xl and Xc, you could create a
: window where the reactance would be low, creating a bandpass filter.
: Am I right?

Um, almost. If you keep the load resistance the same and change
Xl and Xc, keeping the resonant freq constant, you change the
bandwidth of the filter. A single L-C resonator is indeed a filter.
But to make a filter with a _flat_ bandpass and _steep_ cutoff beyond
that bandpass, you would add more L-C resonators which are coupled
together one way or another. The result can have any of various
passband shapes, and some common ones are known by names like
"Butterworth" and "Chebychev" and "Bessel." But what you can do
with a single L-C resonator is relatively limited. If you increase
the bandwidth (lower the Q), then you also lower the attenuation at
all frequencies away from the center frequency, including the freqs
where you want attenuation.

There are many whole books on filter design, and some of them are
really quite good at giving you an overview of the shapes and why
you'd want one or another. I don't have a specific reference handy,
but if you have a decent library or tech bookstore handy, you
should be able to find one that resonates with your learning style.
(Pun only partially intended. ;-)

Oh, by the way, in your single L-C example, whether the bandwidth
increases or decreases with a drop in Xl=Xc depends on if you are
dealing with a "series resonant" or "parallel resonant" tank: that is,
whether the (fixed resistance) load is in series with the L and C or in
parallel. If it's series resonant, lowering Xl=Xc broadens the
passband (lowers the Q), and if it's parallel resonant, lowering Xl=Xc
narrows the passband (raises the Q).

Hope this helps a little...but there's lots of detail left out.

: Hi
: a friend wants for some reason to build a VCO covering 30-90 MHz with
: an output of +13 dBm and keep the harmonics and spurs down at -50 dBc.
: With this wide band coverage filtering would need a tracking filter as
: a low-pass would do no good until the VCO is over 45 MHz.

: Oh! I forgot to say the oscillator is to be swept so a switched filter
: bank is out of the question.....

Ouch. Just to cover that range with a fixed L and variable C requires
a 9:1 change in C, and trying to keep the distortion low in the osc
with such a change in L:C ratio would be a neat trick, I think. It
might be possible with a good AGC circuit. I really hope he doesn't
also want low phase noise.

I think that your mixing suggestion is likely to end up using fewer
parts and be easier to implement; in any event, somebody is going to
have to learn something...your friend may cease to be an RF novice
after this adventure.

> About 6 months ago I took a crashed hard disk apart to see if it
> was mendable. There was a hell of a permanent-magnet field in
> there, it seemed to be associated with the r/w heads.

I just got a bagful (30 or so) of *smashed* HDD's -- a company had apparently decided to upgrade some machines, and didn't want any confidential information leaking out. Rather than spend the time to reformat the drives and then donate them to a worthy cause -- these were 500-meg to 2-gig SCSI drives, some fast/wide -- they had someone go after each one with a hammer. :-(Of course, if their corporate secrets were *that* tempting, I could have taken these drives to any of the standard data-recovery firms and gotten a good bit of info; even after you've smashed them hard enough to crack the case, most or all of the platters are still physically intact.

In any event, all the drives I've opened so far have several elements in common. There's a linear (actually, angular) actuator for the R/W head stack; this is a coil between two metal plates, each of which has two *really* *really* strong PMs attached to it. There's usually a smaller solenoid for locking the actuator in the heads-parked position. And, of course, there are teeny-tiny wires leading from the R/W heads, usually to a flexible PC board with a chip directly mounted and epoxy-englobulated to it.

Within the drive spindle, there's a motor; usually, there's an armature with 9 to 12 poles, fixed to the case and driven by four wires from the drive electronics. Within the rotating spindle, there's a magnetized ring with eight poles (or perhaps eight pairs of poles -- I'm not sure). This ring magnet is still pretty powerful, but nothing like the actuator magnets.

The moral of the story: If your company is getting ready to smash some old disk drives, STOP THEM! But if you can't, get the carcasses; there's lots of interesting stuff inside, some of it reuseable, some of it interesting art.

I don't htink you want a trap ckt. You are looking for a bandpass filter.
This type of filter let's a band of frequency go thru while keeping out
other
frequencies. A wide bandpass filter.

Yes. DX4WIN does exactly that. In the Preferences settings you can state your
offset from UTC and the program will make the corrections automatically. Great
program... and fabulous support. There's a demo version available on the web
site: http:\\www.erols.com\pvander

1395. FS HIGH VOLTAGE CAP BANK

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-17 00:00:00 UTC
From: Norman Hockler <norsan@bright.net>
Message-ID: <6r7sg1nkn1@cletus.bright.net>
Source record: 80264

Hi all,

I have a some commercial built high voltage capacitor banks
(used but in A1 condition). A total of 12 Caps are mounted
on a PC board (screws for removal) and each is bypassed with
a 20K, 20 watt resistor. Caps are 800 Mfd @ 450V working
525 surge. This would provide the capability (working) of
5400 volts. Board is 11" long by 7" wide and the assembly
is 5.5 high. $115 plus shipping.

Jim,

Information is not contained in the amplitude of a transition, it is
in the position of the transition. Each bit must fall into the
correct timing window to be decoded properly, otherwise a data error
occurs.

There are many things that affect the amplitude and location of the
write transition, and many more things that affect the apparent
location during readback.

Timing is the key - amplitude is needed only to bring the signal out
of the noise generated in the preamplifier. (Although more advanced
schemes like PRML do use signal amplitude as well.)

The magnetic recording field is so vast, I could hardly hope to do
justice to this topic in a few lines, and wouldn't even try.

There is a wealth of information available on the web. Here are some links to get you started:

> Bert Douglas
\

TEM means transverse electric/magnetic mode. That is electromagnetic propagaion in which the electric field is orthogonal (at right angles) to the magnetic field, and both are orthogonal to the direction of propagation. Examples are free space propagation of radio waves and standard coaxial propagation. In coax the electric field is radial between the inner and outer conductors and the magnetic field is circular around the inner conductor. At all points they are at right angles to each other.

In wave guide there can be higher order modes in which the electric field or the magnetic field (or both) make one or more polarity reversals within the wave guide. And there are propagation modes where either the electric or magnetic field are not orthogonal to the direction of propagation.

Hope that helps,

Gray

Hi All,

I have an Icom R71A which has an option board installed I would like to identify.

The board is labeled SPRINTPAK and ICOM/AD. It has a RS232 line driver IC (1488) on the board, therfore I assmue it is a type of PC interface.

Any help would be appreciated.

Regards
Aaron

Hi Dennis
If the RFI is affected by the volume setting, it is likely the speaker
wires that acts as antennas and you should try ferrites on the lead.
Try to avoid decoupling caps as the amp might turn into
self-oscillation and you might get degrade high-frequency responsed
(in audioband..).

If the amound of RFI is dependant on the setting of the volume, I bet
it is some of the wires that going into the amp that is the culprit,
in your case the TV-antenna. Try a braid-breaker to rermove RF on the
TV-coax or try a ferrite filter plus a HP-filter in the TV-coax.

Try to filter both the mains lead on TV and your transmitter, using
ferrite rings or clamps.

Good Luck

Jim (inagaddadavida@webtv.net) wrote:
: since you guys brought this up, I would like some information for
: educational purposes only of course. I bought at a flea maket a unit
: that appears to be brand new and it appears to be a linear amplifier.

YEP, it's a linear amp.

: It says killer bee dx 250 hdv on the front panel. It has push buttons
: for power,

To turn it on :-)

: rec amp,

a receiver pre-amp..this is a good idea, but might be a problem in a high
RF area, hence the switch.

: and am.

SSB does not have a steady carrier, so the amp needs to have a delay on
the T/R switch, so it does not "chatter"
On some amps, the above switch may change the bias mode for better results
for SSB.

: There is a dial marked min to max,

The knob is to adjust the RF out.

: and a meter for rf output marked 0-10. On the back is a rocker marked
: ssb off and on.

See above

: It has rf jacks in & out and the power cables. I'm ashamed to
: tell how little I paid for it. Can any one tell me the functions of
: each control, what the power requirements are (12volts?)

12 volts is most likely correct.

: and what frequency band this was designed for? The guy said it was for
: cb but since this is illegal, what is its proper use and how many watts
: output can be expected?

The guy was correct-the unit was primarly designed for 11 Meter CB use-and
yes it is ILLEGAL to use it for that purpose.
However, it should work just as well on the 10 meter ham band-and it is
fully legal to use there!
As for the power output, the 250 in the model # should be a clue..BUT that
could mean continous/peak output or input to the output stage or who knows

what.
A good way to get a clue of the actual power out possible is to find the PA transistor(s) and look the transistor number up-the rating of the PA transistors will give a fairly good idea of what to expect...of course, your mileage may vary depending on the drive requirements and weither the amp is biased right.

Interesting nickname, so it serves me right if I take the bait, but here goes: the logic behind the argument here is that people are "free" to possess all sorts of things that would be illegal to use, like CB amps, bomb making plans etc. What is the point? Seems like a lot of trouble to go through to a) buy something you never intend to actaully use <wink> and b) seek advice on repairing and making operational something for "educational/informational purposes only" I love those disclaimers in Paladin Press books, especially since yelling fire in a crowded theater is still very much wrong and tortable despite any such sham. You get what you pay for, which in this case may be a nice electic shock.

Oh Yeah! Just check out r.r.cb anyday, you will see a lot of actaully hilarious "technical" claims and advice, all given with a straight face. I think transistors are "short circuiting" natural selection among CBers. In the tube days, most of these geniuses would have long since been fried by the 600V B+ in their radios.

>If there is a SOIC package this would be helpful. Anyone got any info?

Only available as SSOP. It is not as hard to solder as You think.
Uase very thin solder wire and, if You can get some, solder flux.
First solder the two edge pins (if You don't use tons of solder, it does
not matter, if You get solder bridges.
I then use a pen style solder flux "drawing" a straight line all over
the pins.
Then I put some solder on the (as fine as possible) solder tip and
solder the remaining pins with one single movement. Due to the solder
flux no bridges occur (and the possible bride at the edge is removed
automagically). Works from small SSOPs to big PQFPs.

I am told that Texaco sells a reasonably priced lubricant in their local stations that is identical to the turbine oil they sell for big bucks for use in jet engines. That should be great dummy load oil! 73, DavidC AA1FA

Antique Electronic Supply in Tempe AZ has replacement decal sets for
many of the old tube radios and generic ones too, and perhaps dry
transfer as well -- useful front panel words and numbers and logos,
not just letters.

(to whoever mentioned it: Thanks for the remark about date-codes on dry
transfer. I'd noticed that my 25 year old sheets weren't working so
well. :-)

> detector. why do you people put up with such drivel?

If the Pointy Haired Manager doesn't have a radar refelctor up his
mast first, see if you can become his life insurance beneficiary.
If they can see him, they'll toot their horn if they need him to
move. The reflector will protect him much beter than a detector.

If the Pointy Haired Manager is willing to trust you with his life
this way, I hope he rewards you well. I'd suggest his
hole-in-the-water-into-which-he-pours-money (yacht) may have other
safety problems besides the gerry-rigged radar detector he's
requesting, if this is how he does his safety equipment.

Unless he's planning on smuggling, he'd be better off with an
active radar than a radar detector.

On to the technical matters ...

There are a couple of issues here.
1) Marine radar detector needs to detect marine radar, not police
radar. Are they on the same bands?
2) A marine radar detector must be omni-directional; police radar
detectors can squint forward for some antenna gain.
3) A marine radar detector for a sailing yacht (assuming the PHM's
boat is not a glorified cabin cruiser) should definetly be a
two-piece unit, with a mast-mounted receiver/detector and a deck-mounted
annunciator.
4) A marine radar detector must survive in a harsh salt-spray environment
and sometimes even seas crashing past the mast.

Even if a police X/K band detector will detect the marine radars, it would
need a whole new packaging for it's new environment. About the only
thing that doesn't change is the likely availability of 12v power,
but on a ship, you probably want to provide an internal backup for
that, as when you're dead in the water is a particularly interesting
time to know you're being painted by the Kobiashi Maru's collision
radar. (Again assuming it's not a glorified cabin-cruiser
day-sailing out of port. If it is a glorified cabin-cruiser,
check if police radar detectors pick up marine radars.)

> > understand it you just use a rf diode as a detector and then normal
> > low bandwith analog stuff

The standard police-band detectors are simple heterodyne receivers;
they set the RF diode in a resonant cavity and let it oscilate, and
if it down-converts an incoming signal, the IF circuitry will
trigger it. But downcoverting from microwaves all the way to audio-analog
is not one step, you'll likely have an IF stage before a second
traditional detector to baseband analog or digital. The RF diode is
an oscilator/mixer. (As such, it radiates, and that's how the
troopers could have radar detector detectors ...) They're usually
tunnel diodes or IMPATT or ... something with a good negative
resistance zone that fits the frequency and physical geometry of the
device.

Making an omnidirectional microwave receiver's anteanna without moving
parts is an interesting challenge. I don't see how a CP patch antenna
would help here. Maybe you could make a circular array of Beverages
(since the wavelength is so short) and stick it in a discarded
radome housing. The key to Beverages is lossy ground, so you'd want
to use non-microwave-rated PC board for this part only, I guess.
(What a Weird idea. I wonder if it'd work.)

Use mineral oil. The best part is the look on the clerks face at the
local drug store when you buy 8 pints...

I spent time today answering questions on repair of radios only to have the mail returned "Host Unknown" because of someone's anti-spam tactics.

I will not try again to contact these people nor will I try to fix their address.

If you ask for help on a newsgroup or by direct e-mail to someone(both of these today) then get rid of the anti-spam. I don't have the time to play games.

Thank you,

Somewhat Related... I just stumbled on a link to a paper on TEMPEST and radio-reception of computer-generated signals; the paper contains the following paragraph:

A side note for designers of unusual radio transmitters: a PC graphics adapter can be transformed into a digital short-wave transmitter by connecting a suitable antenna to the video output. With no monitor connected, we can set xd = xt and yd = yt to suppress the sync pulses and blanking intervals and get a clean spectral shape. With carefully optimized software, modern processors can fill video memory faster than the graphics hardware reads it out, opening the possibility of real-time voice and data transmission either using a standard laptop or with at most a very simple RF output stage.

They provide details on how to intentionally modulate the video signals to either transmit data when the screen isn't in use or surreptitiously while it is in use or to obscure the inadvertent data inherent in the signal. A good paper for anyone carying about industrial espionage, but also interesting as a way to make an HF radio transmitter out of a video card! They shows how to construct video images that result in FSK or AM modulated shortwave (3-30MHz) signals.

(They dismiss VHF because cheap receivers for HF are AM, for VHF are FM, and current chip speeds make FM at VHF speed awkward. This is ignoring the AM Air-band on even low-end scanners. Does the Brit anti-scanning law prevent them from owning airband AM receivers? *shudder* They do use VHF/UHF for direct reconstruction of the video image however, very nice demonstration of unintentional VHF FAX transmissions.)

73 de N1VUX

Never mind that the signal would be many MHz wide. This wouldn't make very many of the current SW spectrum occupants very happy. Also, the antenna system would need to have a similar bandwidth with minimal phase shift for high quality transmission. No easy feat at HF. I guess if it was a very low power system for industrial espionage, etc., this would be okay.

I just want to say that I have used LOG-EQF for several years and it is great.
You will not find another program that is supported by the writer as well as
this one. Tom does a great job.

You are going to get lots of replies to use mineral oil. And it will work fine, but I think it reduces the power handling a little bit (cant remember exactly how much). What I want to let you know, is where to get it. If you buy it in pints or whatever at the drug store, it will cost a fortune also. Buy it from a veterinary supply outfit. It is the same stuff, but may have a picture of a horse on it. It comes by the gallon and is much more reasonable. You may be able to get it at a farm coop store, or you can mail order from several places. Jeffers is my favorite animal supply mail order outfit.

Plain old mineral oil from the nearest discount store works fairly well
up to the 200-300 watt level. The checkout clerk sure looks at you
funny, though, when you check out with 8-10 jugs of mineral oil labeled
for use as a laxative! ;^)

If you're too busy to click a mouse, you're workin' too hard. You need to get
some R&R.
All you gotta do is put instructions in your sigfile. You can also put
instructions in the
reply address. You can make it so people can just click to reply...see below.

If you're only getting 2 spams a day, you don't post much. I used to get dozens a
day
before I started antispamming.

Keep in mind that this is a beta posting and the faq will be re-written and cleaned up over the next couple of months. This is just a first draft. Any suggestions, please feel free to e-mail me, my address, and info on how to un-anti spam it, is on my sig below.

-----begin file-----

FT-50 software mod faq v.01

This faq was written based on an article by another who's name was lost. Credit for the idea goes to that person, but some credit goes to me for re-writing it into a simpler and easier to understand form for those unfamiliar with hex editors.
The following information is based upon exploration and tests performed with an FT-50 with 6H07 as the first four serial numbers, and ADMS software v1.04 for Windows.
Legal stuff: Transmitting outside of legally allowed bands is quite illegal, so just don't do it. This is even true if you have a liscense to operate on other bands and have other business radios that do that. The FT-50 isn't type accepted to x-mit on any other band other than amateur freqs and for MARS / CAP use.
By performing any of the following mods, you take full responcibility. If you get caught doing anything illegal or if you screw up your radio, don't come whining to me, it's your fault, not mine.

Now, the faq:

q.) What is the software modification and how does it differ from the hardware modification?

a.) The FT-50 is rather unique in the fact that unlike other radios where a series of diodes or resistors that connect to the CPU from outside of it and specify what frequencies the radio can operate on, the FT-50 stores this information as a series of two bytes of information in it's RAM in the CPU. No hardware is used at all to specify or control these bytes. The hardware mod above does nothing more than let you change these bytes with a menu system built into the radio. Removing the chip resistor in and of itself dosen't free anything up other than letting the user access this menu system.
Removing the blob of solder governing the MARS/CAP access is another thing. This is the only mod that is hardware affected. But it is possible for one to not FrEEband the radio but instead MARS/CAP the radio by the same software mod. But this dosen't change the country settings or let one switch to FrEE mode like the true software mod does.

For the software mod all one needs for tools is a Hex editor for
their computer, a personal computer, and the ADMS-1x interface kit.

q.) Hex editor, What's that?

a.) A hex editor is a program to edit a computer file at it's most
basic level, the individual hexadecimals.
Hexadecimals work like this: thay're just like the standard numeric
system, but they go a little farther. Like 0,1,2,3,4,5,6,7,8,9 then
repeating is what we're all familiar with, but hex numbers work like that
but 0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F then repeating. So 45 would be 2D in hex
or 2Dh. 157 would be 9Dh, 07 would be 07h, etc. The calculator that comes
with Windows does hex conversions so you can play around with them.

q.) How do I use a hex editor?

a.) Here's a crach cource for hex editors, you can read the readme and
help files that come with the editor to learn how to use it in more detail.
When you open a file, you'll see the following:

00000000 47 49 46 38 39 61 01 00 01 00 80 00 00 FF FF FF
GIF89aï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½
00000010 00 00 00 21 F9 04 01 00 00 00 00 2C 00 00 00 00
ï¿½ï¿½ï¿½!ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½,ï¿½ï¿½ï¿½ï¿½ï¿½
00000020 01 00 01 00 00 02 02 44 01 00 3B ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½Dï¿½ï¿½;

This is a 1x1 transparent GIF that I use on my web page, But you get
the idea.
The pairs of hex numbers represent a single byte.
On the left side is where you are, in the middle is the acual hex
itself, and on the right is a plain text translation of what the hex
represents.
You change the values by clicking on an individual hex character
with your mouse. It'll then start blinking. Now let's say you want to change
FE to 09, you wouldn't type in 9, you'd press 0 then 9 on teh keyboard. The
cursor will then go to the next hex to edit. You can use the arrow keys to
move the cursor up and down, back and forth. The only keys that'll work are
the 0-9,a,b,c,d,e,f, arrow keys and the tab key when within the hex side.
The a,b,c,d,e, and f are case insensitive, so you can have the caps lock set
to whatever you fancy.
By clicking on the plain text side or pressing the tab key you can
switch to full text mode. Here, whatever key you press on the keyboard,
except for the tab key, will generate ASCII text on the text side and hex
values for that text on the hex side.
So if you type in "Text Goes Here" you'll get:

00000000 54 65 78 74 20 47 6F 65 73 20 48 65 72 65 Text Goes Here

With hex editors when you type in text or change characters, the
rest won't move around like with Notepad or other text editors.
And finally, when you chenge any of the hex or text, what has
changed will change color from black to red. The acual colors may vary from
hex editor to hex editor.

To summorize, to change a 04h to a 6Eh, open the file into your hex editor. Scroll the side bar to where the byte is that you're interested in. Click on it with your mouse, then press "6" followed by "e". The hex char will change color and your cursor will move to the next char. Then select the "File" then "Save" from the menu. The color of the byte will return to what all of the other chars are, but the cursor will remain where it was left. You can now close the hex editor with your altered file now saved.

q.) Where can I get a hex editor from?

a.) They're all over the place. Search for one in Yahoo or Alta Vista. My hex editor of choice for the beginner and for occassional use is HEdit by Yuri Software. You can use the FTP search engine http://ftpsearch.ntnu.no/ and search for "hedit" to locate a copy of HEDit on a FTP server the 'net somewhere.

q.) Now that I know what a hex editor is and roughly how to use it, how do I use it and my ADMS interface kit to modify my FT-50?

a.) Ok, now onto the fun stuff, how to do the software mod itself. The ADMS computer interface let's one dump or download all of the information stored in the FT-50's ram. This is then manipulated and changed by the incuded software, and then uploaded back to the FT-50. When the memories are in the radio itself, there's no way to edit the individual bytes, but after downloading to the PC, it's quite vulnerable and can be easily edited and changed to whatever the user fancies then re-uploaded back to the radio. The only secret is knowing what bytes need be altered, and here thay are:

First, download your memory from the radio and save it as a file. This following information is based on tests done with ADMS software v1.04. If the files your ADMS software saves files that are 9184 bytes in size and have the extentions .TPL or .RDF then you can most likely alter the country byte. If you find that you can't alter this byte because Yaesu has had RT Systems change their ADMS software to not let users do this anymore, then you can get an older copy of the ADMS software from a friend or someone else who has it.
The two bytes that govern the country code are located at 5E3h and CE7h. Your hex editor should show you what byte you're on at the bottom of the screen.

000005E0 02 24 03 01 00 24 00 80 21 08 00 00 14 69 50 00
ï¿½$ï¿½ï¿½ï¿½$ï¿½ï¿½!ï¿½ï¿½ï¿½ï¿½iPï¿½
^ this one (5E3h)

00000CE0 FF FF FF FF FF FF 03 01 03 01 04 FF FF 64 40 FF
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½d@ï¿½
^ and this one (CE7h)

In the example, some of the other bytes will vary from radio to radio, so don't be suprised if yours looks a little diffrent. But the country byte should be at 01 if your radio was sold in America.
The first byte is more of a security or protection byte that's supposed to keep you from doing what you're about to do. It must be set to

what your radio currently is at, or left alone, depending on the situation.
The second is what you change to get your radio to what country you
want it set to.

So, in order to freeband the radio, first download what's currently
in the radio and save it as a file. Now open it into a hex editor and find
the bytes of interest to you. You wouldn't change the first byte, but you'd
leave it alone. All you'd change is the second byte. You'd set that byte to
06 in order to freeband it:

000005E0 02 24 03 01 00 24 00 80 21 08 00 00 14 69 50 00
ï¿½$ï¿½ï¿½ï¿½$ï¿½ï¿½!ï¿½ï¿½ï¿½ï¿½iPï¿½
^ 5E3h

00000CE0 FF FF FF FF FF FF 03 06 03 01 04 FF FF 64 40 FF
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½d@ï¿½
^ CE7h

You'd now save the file, then switch to the ADMS program and re-open
your file. Now upload it to the radio. If you get a CERR message on the
display, something went wrong either with the upload / download process, or
when you altered the byte. But 99.99% of the time, things will go without a
hitch.
Now confirm that you're radio has been freebanded by going into a
VFO and extering 50.00mhz. If it accepts this, then try and x-mit on this
freq. The radio should not x-mit, but make a pop sound for an instant then
just sit there not x-mitting. But you'll notice no "ERROR" being displayed
on the screen. If this happens, the radio has now been freebanded.
If all you're doing is freebanding is a friend's radio, you'd stop
here, but there's a problem if you have lots of other FT-50 memory files
stored that you use. If you try and upload them, you'll get an instant CERR
message if you try and do so.
So, you'll need to alter all of your other data files to match the
new country code setting.
Go in with your hex editor and change both the security byte and the
current country byte so that they both match the radio's current settings.
Like this:

000005E0 02 24 03 06 00 24 00 80 21 08 00 00 14 69 50 00
ï¿½$ï¿½ï¿½ï¿½$ï¿½ï¿½!ï¿½ï¿½ï¿½ï¿½iPï¿½
^ 5E3h

00000CE0 FF FF FF FF FF FF 03 06 03 01 04 FF FF 64 40 FF
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½d@ï¿½
^ CE7h

You'll need to do this with all of your files, but then they can all
be used again.
If you want to reverse the freeband mod and go back to the country
code you had before, simply follow the above instructions, but use 06 as the
country you had before, and 01 (or whatever other country you want to use)
as the country you're going to set it to. Like:

000005E0 02 24 03 06 00 24 00 80 21 08 00 00 14 69 50 00
ï¿½$ï¿½ï¿½ï¿½$ï¿½ï¿½!ï¿½ï¿½ï¿½ï¿½iPï¿½
^ 5E3h

00000CE0 FF FF FF FF FF FF 03 01 03 01 04 FF FF 64 40 FF
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½d@ï¿½
^ CE7h

q.) But from the old hardware mod I remember things like "BAND_B2a".
What you just said only changes "BAND_x2a", so how do I change the sub part
after the letter?

a.) That "BAND_B2a" stuff is part of the radio's internal menu system to
change the country code settings. The letter is the country, while the
number and letter after it specify details about the country. Like 1 is
without extended recieve where you can only recieve on the freqs you can
x-mit on and 3 is standard operation but with the ability to recieve almost
anywhere, like it normally is. The 2a and 2b settings involve the MARS/CAP
mod, and I have yet to explore those.

q.) So, how do I change the sub country setting with the software mod at
the same time?

a.) I haven't had much success doing this, but I soon hope to have this
cracked. From what I've been able to figure out, two bytes govern the sub
country setting. These are:

00000CE0 FF FF FF FF FF FF 03 01 03 01 04 FF FF 64 40 FF
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½d@ï¿½
^ ^
| CE9h
CE8h

CE8h is the main one, it's at 00h for "1", 01h for "2a", 02h for
"2b", and 03h for "3".
CE9h controls the extended recieve. It's set to 00h for no extended
recieve and 01h for extended recieve.
If I change just CE8h then the ADMS software corrects the file and
set's it back to 03h if CE9h is 01h, and back to 00h if CE9h is 00h. It also
does this if I set it to 01h and 02h. :(Some byte needs to be set to
specify a MARS/CAP mod.
The good thing about this is that there's no security byte, you can
change these bytes to your heart's content in whatever file you want.
I'll soon have this cracked, but keep in mind that this is just a
beta FAQ.

q.) Well, have you at least figured out what all of the country codes
do?

a.) Most of them. Figuring out what the frequency bands took long enough,
I admidt to getting lazy and not figuring out what the default repeater
splits are, and what the other country codes do to other default settings.
Hey, it took me long enough to figure out what I did figure out.
Here's the byte settings as they relate to the old hardware mod:

```
| 00 01 02 03 | <- sub-country byte (CE8h)
---+---------------------+
00 | F1 F2a F2b F3 |
01 | A1 A2a A2b A3 |
02 | B1 B2a B2b B3 |
03 | C1 C2a C2b C3 |
04 | D1 D2a D2b D3 |
05 | H1 H2a H2b H3 |
06 | FrEE FrEE FrEE FrEE |
---+---------------------+
^- main country byte (5E3h & CE7h)
```

Here's what country each country byte goes to:

```
---+------------+
00 | ? |
01 | America |
02 | ? |
03 | ? |
04 | ? |
05 | Canada? |
06 | Freeband |
---+------------+
```

Hopefully someone can fill me in with what country codes go what
countries that I've lsited as "?".

q.) What bands does each country code let you operate on?

a.) Glad you asked, I spend three hours making this table:

```
country sub-byte (CE8h)
| 00 | 01 | 02 | 03 |
---+----------------+----------------+----------------+----------------+
| tx | tx | tx | tx |

Here's my situation:
I have a portable stereo ,with a brushed aluminum front, that the lettering has significantly faded on.

I'd like to reletter the front panel ,so I need some software I must be able to lay out the position of the controls ,and work the lettering around it.

MSpaint has no facilities for dimensions ,and a small CAD program I use ,won't look to good.

This is a kind of tail wagging the dog question. I live in a very small apartment, so when I get around to buying my first radio, it is going to hve to have a "small" antenna and a power output that won't fry my brain. So, what frequencies (tech level) should I consider?
Dennis

If you read the NG, you would have seen a lot of discussion about DDS.

The hottest chip amongst HAMs seems to be AD9850 with all built in and
a max clock of 125 MHz, and then there is its bigger brother AD9851
with max clock of 175 MHz and internal PLL-regeneration of clock with
multiplication factor of 6 so a low-freq clock is only needed!!!

Cheers

Hi Tom!
yes you're correct, designing such an oscillator is hard, especially
if you want good performance too.

Currently he uses a MC12048 (not sure if number is correct) which is a
1 GHz version of the "famous" 1648 oscillator.

He is then using an MVAMxxx varicap to get the cap-ratio.

So far, he has an oscillator that do cover the wanted range but not
giving him the spectral purity he wants. So he is now expermenting
with all sorts of ideas including loading (sic) the LC-circuit. I feel
he is really out on deep water. But then again maybe he is lucky and
find a way, by not thinking as an RF-engineer.....

Cheers

Jay,

Voltage Controlled Oscillators (VCOs) are usually controlled by Voltage Variable Capacitors (VVCs). You can buy VVCs ready made, with specific range of capacity, or you can "roll your own", using either diodes or the emitter-base junction of a bipolar transistor.

I write a monthly column for the local Ham club entitled "Wanna Tinker???", and we are currently building a 40 meter transceiver that uses a couple of VCOs (one in the main VFO, and one in the product detector).

I would be happy to sent you a copy of the column via e-mail, if you are interested.

Any Homebrew types going to the Roanoke, VA hamfest this SAt?
I'm hauling a really neat 40's-50's 19" rack mount transmitter along.
Several huge sections + the PS and a couple of blank panels. CHEAP!

Not a problem at all. Even under Windows, the LPT1 port can send and receive tens of thousands of bytes per second worth of data. Say you're running a 640x480 display. That can be handled with two bytes' worth of input data per pixel, or 1280 bytes per frame. (No need to send the X data, obviously.) A 30-frame-per-second display, which is more than anyone needs in a conventional spectrum analyzer, is perfectly feasible.

My Tek 492 maxes out at 10 FPS, with what amounts to a 512x512 display -- one of these days, I'm going to rewire the DB-25 feature connector on the back as an LPT1-compatible interface. Think about how much data a Zip drive, or a Snappy adapter, can squeeze through that port, and you'll realize you're selling it short.

> If you use a dedicated interface board, you could probably get the
> performance, but that drives up the cost/complexity of the system.

No need for that. Every time I've *thought* I've designed something that needs a dedicated ISA interface board, I've always realized that the parallel port is plenty good enough for my needs. Even if you have to do high-speed data acquisition (e.g., for a digital storage scope),

it is still easier to do all the necessary acquisition and buffering outside the PC and pipe the data in through the LPT port. Considering what ISA prototyping cards cost, you can afford to put a lot of buffering and glue logic into a dedicated parallel-port solution.

Swisslog for windows can do this. You can enter the difference between
UTC and your local time but you can also stop the automatic insert of time
and do it yourself.

Steve;
I'm not really familar with this amp. However, it is common that the transmit bias for this type of tube be adjustable for the proper resting current or operating bias. In the receive mode, the T/R relay usually adds a resistor in the bias circuit that increases the bias voltage to well above cut off (no current flow during receive. If this resistor opens, the amp will show plate current flow during the receive mode---I would check this. By the way, if you ever need NEW tubes, I have two Eimac's new in the orig. boxes I would part with at a big discount. 73 Bill AF4LE (N4MXF@aol.com)

>are, I believe:
>2900-3100 Mhz & 9300-9500 Mhz.
I must admit, everybody above has a point. However, going back to the
original question. I can remember a description of some sets that were
effectivey radar detectors that my Father helped design for GEC back in
the late 50s early 60s that were effectively radar frequency superhet
receivers. The object being to receive the radar puses and then do
various analyses on them. The intrest being pulse repetition frequency,
frequency of pulse, amount of frequency change during pulse etc etc etc.
All intended at looking at Russian stuff, naval I think.

So, I guess that if you just did some form of frequency changer you
could feed the output into an appropriate RX and get something no matter

what the radar was, a single long pulse if it was a police handgun type or a series of pulses if it was a search sweep type of system. A CW receiver would give you an audio signal and a simple parabolic aerial would give you a direction system.

Any ideas?.

cheers

Robin

I am looking for a 40M CW transceiver kit and would like some advice.

My consideration list currently includes the following:
Norcal 40A (Wilderness Radio)
1340 (Ten-Tec)
TAC1-40M (S&S)

Am currently leaning toward the TAC1 because of the wider bandwidth (200 KHz) and the digital display. I understand this radio is a little more difficult to build though.

I have kit building experience, but it is a little dated. It's been more than three decades since I finished my last Heathkit.

I would appreciate some input concerning these or other 40M transceiver kits.

Diode switching of the crystals would be worth investigating. It'll
solve lots of problems.

Sounds like the old mod to pull the interface plug during a memory transfer
was accidentally made. What has happened was the radio's country code was set to 00h
which is an european band. The good news is that you can now recieve cell.
Resetting the radio will not affect what the country code is set to. It will
always be stuck unless you change it yourself by specifying a new country.
My "how to modify a FT-50 faq" is going to be posted every week to the
newsgroups. You can use this to perform a software modification to set the radio back
to 01h which is the American plan, set it to 05h which is Canadian (I think) and will
give you extended recieve (including cell) /without/ extended transmit (tx boundaries
are the exact same as US bands), or set it to 06h which is the freeband mode that
everyone likes.
Best of all, you allready have almost everything you need to do the mod, and
you won't have to take the radio apart and do soldering work to modify it.

Best of luck,

1454. HF radio by Video card (was Re: Packet radio by a sound card.)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-19 00:00:00 UTC
From: wdr@world.std.com
Message-ID: <Exwtn1.Lny@world.std.com>
Source record: 80142

Somewhat Related... I just stumbled on a link to a paper on TEMPEST
and radio-reception of computer-generated signals; the paper
contains the following paragraph:

A side note for designers of unusual radio transmitters: a PC
graphics adapter can be transformed into a digital short-wave
transmitter by connecting a suitable antenna to the video
output. With no monitor connected, we can set xd = xt and
yd = yt to suppress the sync pulses and blanking intervals and
get a clean spectral shape. With carefully optimized software,
modern processors can fill video memory faster than the
graphics hardware reads it out, opening the possibility of
real-time voice and data transmission either using a standard
laptop or with at most a very simple RF output stage.
"Soft Tempest: Hidden Data Transmission
Using Electromagnetic Emanations"
in Second Workshop on Information Hiding,
Portland, Oregon, USA, April 15-17, 1998.
Markus G. Kuhn and Ross J. Anderson
University of Cambridge, Computer Laboratory, New Museums Site,
Pembroke Street, Cambridge CB2 3QG, United Kingdom
{mgk25,rja14}@cl.cam.ac.uk
http://www.cl.cam.ac.uk/~mgk25/ih98-tempest.pdf

They provide details on how to intentionally modulate the video
signals to either transmit data when the screen isn't in use or
surreptitiously while it is in use or to obscure the inadvertent
data inherent in the signal. A good paper for anyone carying about
industrial espionage, but also interesting as a way to make an HF
radio transmitter out of a video card! They shows how to construct
video images that result in FSK or AM modulated shortwave (3-30MHz)
signals.

(They dismiss VHF because cheap receivers for HF are AM, for VHF are
FM, and current chip speeds make FM at VHF speed awkward. This is
ignoring the AM Air-band on even low-end scanners. Does the Brit
anti-scanning law prevent them from owning airband AM receivers?
shudder They do use VHF/UHF for direct reconstruction of the
video image however, very nice demonstration of unintentional VHF
FAX transmissions.)

I guess I won't be getting any help from you on newsgroups<g>..

I wish it was possible to post with my real email address. It would
sure make things easier on everyone involved. But I didn't get an
Internet account in order to waste my time downloading spam. And if I
post with a valid address, spam is 95% of what I get. (*literally*.
Yes, that's 19 spams for every valid message...)

Maybe someday, we'll be able to get rid of this scum & it'll become
safe to post one's email address in public again. For the time being,
I'm going to have to keep mucking. If you want to reply to my
thoughts, post it in this newsgroup - I'll see it -- and with no spam
in my mailbox, I'll actually have time to read it...

(I should say, I agree that it's rather dumb to ask a question in
direct email & not provide a valid return address! Which doesn't mean
I haven't screwed up & done so in the past...)

I just use Paintbrush. I keep a couple of bitmap files of collections of symbols, and just copy and paste them together. The symbols are all easy to draw using circles and straight lines cut and pasted, flipped orizontally or vertically as necessary. Then, when I am satisfied with the circuit, I select only the part of the bitmap image containing the circuit, and copy to a new file. I exit Paintbrush without saving changes so I have my symbol collection to work with again next time. I use Graphics Workshop to convert the saved drawing to gif or jpg format. Remember to set the image attributes to black and white in paintbrush. If it is set for color, even if you only use black and white in the drawing, you will have a bigger file. This may not be the most elegant way of doing this, but it makes use of resources that I already have and am familiar with.

I agree with Cliff. I have been on the net for over 3 years with none of
this anti-spam nonsense and I get maybe 2 a day. BIG DEAL.
I don't have time to check every return e-mail to see if their is some
anti-spam gunk in it. I usually find out an hour latter when the bounce
back shows up. What a pain.

I think that any electrical supply will have transformer oil that meets current environment standards which should work well in the dummy load.

Check out my sig file with the "mailto" thing. Just click on it to send me mail. Maybe this would help folks.
BTW I am on the amps,vhf, and collins reflectors, plus have curent ads on rec.radio.swap, rec.radio.amateur.equipment,alt-ham-radio.vhf-uhf, and ads on 3 swap boards. I get about 100 e-mails a day here from all of this. Still just a couple of them are spams. Think that makes me active on the net :).

Your ISP must have an excellent anti-spam server. Mine installed one
several months ago and it helped a lot. Otherwise the spambots just
search for "mailto:" and take your suggestion literally.

I munge my email via a small software program to switch between
newsgroups and regular email.

But the instant I goof and include my real email address in a newsgroup
posting, I get swamped with junk mail, despite the spam filter my ISP
installed.

You can't win!

Best Regards,

Mike

<snip>

What amazes me is people who post a question on a news group and
specifically request an e-mail reply.

Perhaps others are interested in the topic.

Perhaps other readers are interested in seeing if help has already been
extended.

Perhaps those who take such steps are really just using newsgroups without
ever going to the trouble to put anything back in.

If I see a request for help or information with some lame excuse about
sending an email reply because I don't read this newsgroup often it simply
put a kill filter on the author for 3 months.

Seems to me that if you post it, be prepared to come and look at what
others offer. And in doing so you can avoid the need for email addresses
anyway.

Spam skimmers can read "mailto" lines. They may not expect to find
them in newsgroups though. They don't help someone who isn't using a
Web browser to read the news, though they're at least as good as
posting a munged copy.

(for that reason, I put my email address on my Web pages by typing it
as characters in a Windows Paintbrush picture & then saving it as a
BMP & posting the image. Again, a pain for those who want to email
me, but so far I've only received three spams at this account. My
guess is someone else posted an unmunged copy of my email address on a
Web page somewhere...)

David:
Use transformer oil and avoid mineral oil or especially anything which may contain PCB's. In the 70's there was a lot of brands of oil on the market such as coolanol which still can be found at swapfests. Call your nearest oil distributor for information or sometimes you may get your local utility to donate a gallon of transformer oil. I have been successful both ways.

>Never mind that the signal would be many MHz wide.

Why would you think that? I assume they are talking
about using the RGB lines as an arbitrary function
generator. Summed together appropriately, you
could have the equivalent of a 24-bit DAC running
at several tens of MegaCycles. You would probably
need to filter out the pixel clock, and of course you
would want to check it for other spurious emissions,
but there's no reason to believe it wouldn't pass FCC
requirements for spectral purity.

Ditto. My e-mail software won't let me fix addresses
in reply-to mode, and it's a lot of work to get around it.
Newsgroups are primarily for public discussion, and
requests for help may be appropriate, but individualized
replies are better suited to direct e-mail. On occasion,
I might reply to the group for someone using a real name
or callsign, but people who feel the need to hide behind
some phony alias like "lord eros" are not taken seriously.

Maybe not. A large electrical supply distributor here
didn't have any desk clerks who really even knew what a
current transformer was, though they did find them in
their catalog and were very good about ordering them for
me. But for transformer oil, I'd try transformer rewind
shops (that one worked for me when I filled my Heath dummy
load, and for free), local power utility (especially if
you can locate a ham that works there), or petroleum
distributors. I do agree that it's worth getting
transformer oil for the load, especially if you're going
to use it at high power.

Gotta agree with the Pointy Haired Boss comments!
For a little technical data:
All Police radar is a different frequency than marine.
There are actually two frequencies used by ships, which
are, I believe:
2900-3100 Mhz & 9300-9500 Mhz.
There are some other differences. Police radar is
constantly "on', (from the point of view of the frequenciesinvolved,
pulling the trigger on those 'instant on' guns is a
LONG TIME.) This is because police radar relies upon
the Doppler effect to calculate your speed. The unit
must be on and pointed at you for sufficient time to
do this calculation. Marine radar doesn't care about
speed. It cares about MASS. It shows none moving
objects (like LAND) as well as moving objects. It
does this by PULSING its radar beam very quickly and
briefly, and awaiting a return.
Design for a detector would be QUITE different.

...but not impossible. Most good sail boat supply houses can show you the "CARD" system. "Collision Avoidance Radar Detector." It's passive. It tells you (via an LED) from what general direction radar is being seen. Its about $500.

1486. How to build a TV Channel 42 trap?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-19 00:00:00 UTC
From: Curtis <nospam@lilly.com>
Message-ID: <35DB1256.FB4092B2@lilly.com>
Source record: 80174
Cross-posted to: sci.electronics.basics,rec.radio.amateur.homebrew,sci.electronics.repair

Electronics Wizzes,

I need to construct a TV channel 42 trap for my antenna. Right now Channel 42 is swamping out 5 adjacent channels and 1 or 2 harmonic channels. Do you think this is possible? If so, do you have any plans available? If you have any suggestions, please forward those on, too. I'm highly motivated to make one of these traps myself, as a commercial 90 dB trap would cost $176 or string two or three 20 dB traps at $45 ea.--ouch!!

Here are the specs I need:

Input impedance: 75 ohms
Output impedance: 75 ohms
Trapped band: 638 MHz to 644 Mhz (no trapping outside this range)
Minimum attenuation: 30 dBmV (this is a bare minimum, 90 dB preferrable)
Insertion loss: 1 dBmV max.

Send any suggestions to me at cfarley(at)iupui(dot)edu. Sorry for the cryptic email, but trying to avoid spammers. Thanks.

Curtis

Even better: rather than ranting about people who are trying to avoid spam, why not simply refrain from replying to people who request email replies to questions they've posted on the newsgroup? When you reply via the newsgroup, your message becomes available for everyone else to read and benefit from, as well as being archived for years to come in DejaNews. Replying to newsgroup messages via email, OTOH, only encourages the posting of the same old questions and topics over and over again.

JM,

I solve the balance problem by adding a small
value of resistance, (usually a 10 ohm 3 watt
non-inductive), properly bypassed, (.1 in parallel
with a .001 in parallel with a 10UFD. Tantalum),
in series with each of the cathodes.

As a tube starts to conduct more than the others,
it's cathode becomes slightly more positive with
respect to ground; effectively increasing the
negative bias between the control grid and the
cathode. This tends to 'balance' the currents
between the tubes and negates the requirement for
re-adjustment of bias voltages when a tube is
replaced.

>I believe it has an ALC connection on the rear, and that this is used.
>
yes, it seems possible to connect a variable voltage from a potmeter to the ALC line going to Q06 2SK19GR (buffer amp after balanced modulator bridge), I have only parts of documents for FT-221
When reducing power you obviously don't need the alc line.
Another way is to install a higher source resistor (R29=100 ohm), I would connect 220 ohm with another 100 ohm in series with 220 ohm trimpotmeter to adjust the current through Q06 and reduce the gain.

For IC202 the normal procedure to reduce power level down to 100mW, to shortcircuit g2 voltage to ground on dual gate mosfet in TX IF. It is one problem, however, drive level is usually different with different modes, as must be expected for the FT-221/225-series. I spent much time with my FT-902 adjusting the different modes (except AM/FSK) to equal RF levels. FM tx level was very much higher than ssb level, as was cw level.

Yes, and I find zener diodes to be handy for varactors where more capacitance is needed. For the same size diode, the lower the zener voltage, the higher the capacitance. Of course, you have to avoid applying a signal/bias combination large enough to enter the breakdown region. A reverse biased emitter-base junction would probably also produce a fairly large amount of capacitance due to the low breakdown voltage. The RIT in all my HF rigs use zeners as varactors.

Why do manufactures put MODs in their equipment?

Wouldn't it make more sense to manufacture the radio with all possible features ready to go? The MODs make end-users risk damaging their equipment. Can anyone tell me why this is done?

Thanks, and a direct reply would be appreciated.

There were two 2-meter amp projects in the early 70's ARRL Handbook
(I have a '72 and '74). They are class C amps and not linear. The
40-45 watt amp was easy to build.

For Sale:

Dyna ST-70 / PAS-3 / FM-3
Fisher X-100
Sansiu 500a

ST-70

Fully Rebuilt to stock specifications with new resistors, new film caps, new internal wireing, gold Cardas RCA jacks, binding posts and AC cord. Shiny chrome. Brown cage. Strong quad of EL-34 and pair of 7199. This unit has been modified by replacement of rectifier tube with solid state/ diodes. Quad cap has been removed and idividual sections relocated under the chassis. Includes copy of manual and my personal notes file (180+ pgs). This unit looks and sounds great! Some feel that the changeover to diaode recitification improves the sound; here is a good way to find out !

$325.00 + shipping

PAS-3

This is an original factory wired unit in very good condition. It is stock. In good working condtion and sounds wonderfull.
Includes copy of manual and copy of my personal notes file.

$160.00 + shipping

FM-3

This is a good original and stock unit. Strong eye tube.
Wonderfull sound- makes FM enjoyable! Some scratches and smudgeing of lettering. Includes copy of manual and copy
of my personal notes file.

$135.00 + shipping

I will sell as a trio for $575.00 + shipping

Fisher X-100 integrated amp

This unit is in good working condition. NOS powertransformer from the Fisher Doc. New coupling caps. Just back from tech check up. Includes all tubes. Brass face is overall clean with some corrosion around knobs. Some of the knobs are MIA. No case. Includes all tubes

including strong quad of 6bq5. The 6bq5 series of amps are regarded as some of Fisher's best sounding amps. This unit is ready to play !

$150.00 + shipping

Sansui 500a

Unit is just back from an electical checkup. With case and strong set of tubes. Unit looks and sounds wonderfull ! The transformers in this unit are some of the best ever made. The Sansui transformer group broke away to form Tamura; world renowned in audiophile circles for their quality.

$135.00 + shipping

Please reply to: rl1856@ix.netcom.com

Thank you,

Ross Lipman

Without a "green wire" to cut, or SMC diode to remove, what, oh what, would a thoroughly modern amateur radio operator do that could be called "homebrew" :-)

Plus, "mods" serve to drive internet traffic up, thus benefitting ISP's, network providers and network equipment manufacturers when 78 bezillion hams all send "tell me the 'mods'" messages to these newgroups every time they buy something new. Mods? Mods for what? -- to turn the radio into a tractor?

Here's a most useful mod for many modern radio products. ("Radio product" is to radio as "cheese product" is to cheese). My apologies to anyone who classifies Velveeta as a fine cheese ....

Step one: remove the cover -- you know, loosen and remove all those darn little screws. That's right. Every screw you can get a screwdrive on. If there aren't any screws, use the blade of a screwdrive anyway and just pry the thing apart. If that doesn't work, hit the readio product smartly with a large hammer.

Step two: locate the electronics -- this is a difficult, but not insurmountable, task for many thoroughly modern radio amateurs. The electronics is that stuff that you don't know what it is because you haven't read any of the books yet -- well, heck, you didn't need to read any of those books to pass the test, so why bother now? Its easy -- its just that funny looking thing with all those little bumps on it.

Step three: discard this piece (it contains nothing very useful).

Step four: fill the remaining piece (the "lid") with a high grade potting soil, water, and plant your favorite seedlings. If the lid is extremely small, plant only one seedling.

Step five: while the seedlings grow into trees, learn the code, read the Handbook, make a meager attempt to understand Ohms law and memorize the simple formula for the length of a 1/2 wave antenna. Observe the fact that an SWR of 1.00023 to 1 is not an antenna pruning crisis of major proportions, and won't result in the loss of most of your signal in the transmission line. Also note in most any dictionary that "personal" is NOT a noun ...

:-)

just to repeat for about the nth time, in TEM mode the electric and
magnetic fields are orthogonal to each other and also to the direction
of propagation.

TEM applies to free space and transmission lines, but not to waveguides of
any sort since they have modes in which the fields are not orthogonal
to the direction of propagation.

I used to run a Standards Lab. One part per million and all that nonsense. The standard resistors were maintained in an oil bath at 20 degrees Celsius. I asked a supplier where the insulating oil came from. He said it was the same stuff as gents Saturday-night hair oil was made with.

For RF dummy loads it would seem practically anything will do provided all water is driven from it. Try thin common or garden lubricating oil. Or virgin cooking oil. Avoid the very light oils such as gasoline for obvious reasons.

no connetor for radio

$25 shipped

<8>
I also have about 2 dozen 4 wire
mike cords. These are the heavy duty
belden cables that I bought surplus cheap!
I will pass the cheap on to you
these normally go for 9.95 each

$3.00 per cable shipped

<9> sold

<10>
matched pair of mrf497's I was going to build a radio
with high output but the idea fizzled...***note these are the
high output transistors that are used in the hr2510/hr2600/htx100
high output mods****
I also have a matched pair of mrf492's that I was going
to build into a 6m amp, but am going the route of a
larger output radio.

497mp $50
492mp $50

or I will take partial trades

looking for....

KAM version 7 or later with software/cables
6 meter radio dedicated to 6 meter and allmode

2kw or better tuner with wire/and dual coax outputs
with meters

I can be dealt with, if you have trades, let me know

km5rt@ticnet.com

Pursuant to the same laws that govern the fax spammers,
unsoliceted mail will be forwarded to my collection agency
for a $50 fee per message. This modest fee recovers the
time lost reading the meaningless message, the brain time
to figure if it was meaningless, and the time and effort that
it took to kill the OFFENDING message.

If you like CW use it! If not, learn it long enough to make the
test then do whatever you want. If you will not be doing CW on
the ham bands, 13 WPM is probably fast enough for the test. 20
WPM will only get you 75 khz of space for voice for MUCH time and
effort...you weigh the effort to gain ratio...it is YOUR choice
If you are licensed, use whatever bands you are allowed to keep
the agencies and private companies from trying to steal them.

I am presently active on.
80-10 meters ssb voice and fm where allowed, 6mssb,6mfm,
2mssb,2mfm packet,2mfm simplex,220fm,432ssb,440fm,440fmpacket
and whatever I can get my hands on.

GPS stopped making these a couple of years ago. There is no equivalent,
but there should still be some around (at a price) as they were used in
military equipment.

>Thanks
> Stan
>

Are you looking to program the MCX100? You can try this site but the
software he offers will cost you about 20 bucks:

http://www.geocities.com/SiliconValley/5857/

or you can read the following:

The Vhf radio uses this programming directly. For UHF use, divide all
frequencys FIRST by three. Also, Syntor radios use this same
programming
algrothym but have a differnt IF freq on rcv.

I . FREQ. PROMS

Frequency PROMs will be programmed as follows:

1. All locations in the PROM will be filled. Undefined channels will
be strapped to previous channels.
2. "Blank" channels will exist on transmitter only and the PROM word
will
contain all "F" hex on that transmitter channel.

(the read order of the prom is byte 7,6,4,0,1,2 : 2&5 not read)

3. Types of frequency PROMs will be:

A. Case 1 256 X 4 for < 16 channels (N82S129)
B. Case 2 512 X 4 for > 16 channels (N82S131)

Orginal Field proms were MMI 5301-1J for 16 ch, and MMI 5306-1J
for 32Ch. Note: the R1800 field programmer software/firmware
was upgraded to use the Signetics N82S style proms. Other
proms,
once programmed with the correct data (i.e. 74s288) dont use the
same programming algorythms, and will be destroyed by the

programmer.

4. Frequency information for the PROM fills eight consecutive
locations
in the PROM for each channel.

5. Channel locations in the proms are as follows:

16 ch RF prom:

Addr Ch Addr Ch Addr Ch
50-57 R10 A8-AF T5
00-07 R16 58-5F R11 B0-B7 T6
08-0F R1 60-67 R12 B8-BF T7

0A0-0A7 T4 150-57 R26
0A8-0AF T5 158-5F R27

6. The frequency band to be determined by the customer frequencies.

Range Table

Range I 136 < Fc < 162 Mhz
Range II 146 < Fc < 174 Mhz

7. The following steps will be performed to generate the eight PROM words for each channel:

A. Determine range from Table in 6.

B. Subtract 21.4 Mhz from all Receiver freqs.

C. Determine the reference freq.
a. Divide frequency to synthesize by 5Khz
If the result is an integer, then D0,D1 = 1 of word 7
b. If the result is a real number, try dividing by 6.25 Khz.
If the result isnt an integer, then the frequency cant be synthesized. If it is an interger then D0=1,D1=0 of word 7

D. Determine N

N = Freq/REF freq (typical ref freq is .005 Mhz [5 Khz] or .00625 Mhz [6.25 kcs]

E. Calculate Integer NA,NB
NB=INT(N/63)
NA=N-(63*NB)
NB=NB-NA
IF NA=0; then NA=63; NB=NB-64

F. Convert NA, NB to binary bits.
32 16 8 4 2 1
NA= A5 A4 A3 A2 A1 A0

512 256 128 64 32 16 8 4 2 1
NB = B9 B8 B7 B6 B5 B4 B3 B2 B1 B0

G. Construct PROM words 0,1,3,4 from the bits in NA & NB
(note a * means this bit is inverted from the value you got above.
If it was a 1, enter 0 - if 0 then enter 1)

A3 A2 A1 *A0 --> W0

B1 *B0 A5 A4 --> W1

B5 B4 B3 B2 --> W3

B9 B8 B7 B6 --> W4

H. Set PROM word 2 and 5 to 1111 (F hex)

I. Determine PIN shift bit S0 VCO1 VCO2
Range 1 Synthesizer D3 word 6 D2 word 7 D3 word 7
Below 120.6 Mhz 1 0 1
120.6-126.6 Mhz 1 1 1
126.6-132.5 Mhz 1 0 0

132.5-138.4 Mhz 1 1 0
138.4-144.3 Mhz 0 0 1
144.3-150.2 Mhz 0 1 1
150.2-156.1 Mhz 0 0 0
Above 156.1 Mhz 0 1 0

Range 2 Synthesizer
Below 130.6 Mhz 1 0 1
130.6-136.8 Mhz 1 1 1
136.8-143.0 Mhz 1 0 0
143.0-149.2 Mhz 1 1 0
149.2-155.4 Mhz 0 0 1
155.4-161.6 Mhz 0 1 1
161.6-167.8 Mhz 0 0 0
Above 167.8 Mhz 0 1 0

J. Dual front end bit

Bit D3 of word 6 is 0 when FC < (fmax+fmin)/2

A good way to remember this, is, the lower front end is
selected with
the bit being 0, and the high front end is selected with a 1.
Try to
split the total freqs between the two front ends, if your
spread is
greater than 6 mhz.

Assemble the front end bits:
Word 6 = D3(front end bit),D2(S0),D1(1),D0(1)
(D1 and D0 spare - set high)
Word 7= D3(VCO2),D2(VCO1),D1,D0
(1,1 if 5 kc channel, or 0,1 if a 6.25kc channel)
hence VCO2,VCO1,1,1 - if a 5 kc channel
VCO2,VCO1,0,1 - if a 6.25kc channel

Excuse the way this got layed out.. I really dont have to much time to
line up all the words and paragraphs. I have the service manual and
software to program the thing.. so if there is anything you need just
email me. (cant send you the program but I should be able to send you
a raw bin file of freqs that you need) Remember to remove the "x" in
my email address cause I dont need all the spam. Oh and by the way..
whats your call sign?

Difficult! Polypropylene is easier to find, like the Philips 375 series
- 1600V d.c. 6n8 available from Farnell (order code 659-757.

Below is the latest index of L.O.S.A and you can download the
complete L.O.S.A from the following places...

WWW:

http://www.hth.com/losa.htm

FTP:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

1.0 Whats is L.O.S.A all about ?
--------------------------------

I started to compile L.O.S.A because I know there are lots of great
ideas and many problems that are solved with the BASIC Stamp and the
main purpose of this list is to get an idea of what other people are
using their BASIC Stamps for and maybe get some inspiration or hints.

1.1 How can I contribute to this list ?
---------------------------------------

If you have done something (big or small) with the BASIC Stamp that
you are willing to tell others please use the form given below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Visit the following Web site and fill in the contribution form...

Source record: 80101

In my opinion, the best thing about the S&S rigs like TAC1 is that they are synthesized and extremely stable when compared to the typical VFO type QRP rigs. They are however, a little larger and consume more battery power. I've built the TAC1-40 and the older ARK4. Both are great rigs.

I'm looking for plans for making a 2M linear amp to use with my HT/Base rig. I'm thinking 2.5W-5W in & 15W-20W out. I guess I'm flexable on the Watts in and out. If anyone has plans or knows where some plans might be on the web, please let me know. Thanks!

1520. Re: Can anyone explain the bias on a 4CX350 ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-20 00:00:00 UTC
From: LA8AK@online.no
Message-ID: <35dbbc4d.50626724@news.online.no>
Source record: 80105

I have only experience from 8122.....
When it is a risk of driving the grid into positive voltage it is better to use higher screen voltage - which may increase the grid bias setting

The transmitter I serviced has 4x screen regulators and common grid voltage setting for the 4 valves in paralell

If you try first using 350V screen voltage, the bias may be -20V. 400V screen voltage is the highest possible to use. Adjusting the different valves for equal idle current, the screen voltage may vary between 350-380V, then it is better to increase all screen voltage settings, the highest screen voltage to 400V, the 3 other valves need somewhat lower (start with 380v) and increase the bias accordingly, try -24...-30V first, then lower it.
Even 24V grid bias is very low for a power amplifier with great risk of driving the grid into positive region, increasing the risk of burning the valves out, screen to grid shortcircuit.

Best OM,

I need the schematic and operating manual for the Eddystone 730/4
shortwave receiver.
It's an old bleu/grey tube receiver covering .48 - 30 MHz.

The following text is on the receiver :
Reception sets
Eddystone 730/4
ZA 51262
manufacturer STR/NL.

I hope someone can help me, please reactions by email.

Thanks a lot !

No, he wants a trap; he's trying to get rid of WCLJ, not boost it.

The first thing I would try is an attenuator. This will knock down
the strength of *all* channels by roughly equal amounts. But spurious
responses in a receiver are a "threshold" effect - knocking down the
WCLJ signal by 10dB may knock down the spurs by 30 or 40dB, which
improves the signal-to-noise on the adjacent channels by 20 or 30dB.

If that doesn't work or isn't adequate, I'd try a half-wave shorted
coaxial stub hooked across the feedline. Start cutting it a bit too
long, and gradually trim it shorter until the interference is at its
weakest.

> it's a start!

Jim,

That amp will work fine on 10 meters and will
reliably take up to 10 watts drive. More than
that will burn out the variable power control.
It incorporates automatic transmit/receive
switching right now, but a simple conversion can
defeat that option and convert it to direct
control from a rear panel RCA jack. (which
effectively defeats it's CB AMP functionality)
The recieve preamp works well in the unit and is
activated by the white button, or whichever color
is the second from the left.
Power on (operate) / off (standby) is the
leftmost button and usually red.
There may be other buttons which are basically
switched input attenuators and there may be either
a front or rear panel switch to cut in a switching
delay for SSB operation (which would be defeated
anyway if the transmit switching was brought out
to the rear panel jack).
All buttons should rear-illuminate when in their
active positions.
The meter lights up in transmit mode to indicate
that the bias is being applied to the finals. (
The bias supply supplies the meter light it's
power)
The amp has class AB bias and plenty of feedback
and is as clean or cleaner running than some of
the 'built for amateur use only' amps like the old
'Metrons'.
Depending on drive level, you should get at least
a 10DB gain, with the devices starting to saturate
at 200 to 250 watts on a 13.7 volt supply.
The going rate for those amplifiers is $150 to
$250 for a working unit with the variation based
on the physical condition of the unit.
The amp is solidly built and the 'feel' of the

front panel controls and instrumentation reminds
me of the older ALPHA/ETO stuff.

Hope this info helped,

Dennis

<rkerman@mail.bright.net> wrote:

Steve wrote in message ...

>Never mind that the signal would be many MHz wide.

Why would you think that? I assume they are talking
about using the RGB lines as an arbitrary function
generator. Summed together appropriately, you
could have the equivalent of a 24-bit DAC running
at several tens of MegaCycles. You would probably
need to filter out the pixel clock, and of course you
would want to check it for other spurious emissions,
but there's no reason to believe it wouldn't pass FCC
requirements for spectral purity.

de N8OWE
Rick Kerman <rkerman@mail.bright.net>
http://www.bright.net/~rkerman

I'm not sure what exactly the scheme was, but it was supposed to be simple. I don't know of any simple way to take a video signal (in this case VGA or S-VGA or better, which these days has video bandwidths up to 100 Mhz) and compress it into something less than several MHz wide.

The issue of spectral purity is not what I was discussing. A signal can be spectrally pure (from an FCC point of view) and still be MHz wide (see NTSC). Maybe we're talking about two different thing here.

Either way, I hope no one hooks their Vodoo 3Dfx card output to their broadband linear amp and fires up on the HF bands!

Any diode will work as a varactor, after a fashion - I routinely
use 1N914 and similar diodes in Huff and Puff circuits, where
you only want a small amount of tuning.

Of the 1N400x series, only 1N4007, the highest voltage variant,
is useful as a PIN diode.

Sounds like by first novice transmitter that was
built back in the 50's from a schematic in the
ARRL handbook. I didn't have to paint the cabinet
with a black wrinkle finish, they came that way,
from a company called 'BUD' I believe..

I used dry transfer lettering on mine but it took
a lot of time and patience to smash the transfer
into the grooves in the wrinkle finish. The only
advantage was that it did not rub off very easily!

Good luck with the labeling,

Dennis

Is not a VGA card basically three D-A converters interfaced to
appropriate logic?

I would certainly think one could feed the appropriate bitstream to
get a reasonably narrow-bandwidth signal. Taken to the extreme, one
could switch from 0-0-0 on R/G/B to 255-255-255 to generate a CW
signal, only a few Hz wide. Obviously such a signal would not be
displayable on a VGA monitor!

I don't think I'd use it under my license without attaching a bandpass
filter to the output, but it strikes me as a project that might be
possible.

1537. TRANSFORMER LITERATURE F.S.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-20 00:00:00 UTC
From: tubelit@aol.com
Message-ID: <1998082021345400.RAA28539@ladder03.news.aol.com>
Source record: 80122

Hello, I have the following literature that is out of print,
and very hard to find. These are very high resolution LASER
monochromatic reprints of the rare originals. All are professionally
done with original style binding. All sales final on literature,
and I'm sure you'll be pleased. All prices INCLUDE POSTAGE, in the
continental USA. Others by actual quote.
Thanks, and if you need tubes, visit our sister screename,
Tubecntral@aol.com

TRANSFORMER BULLETINS/CATALOGS/MANUALS:

KENYON "Quality transformers",23 pages,has some writing in numbers
on the front cover by the original owner,but a real information
getter. Covers ALL transformers available in Dec.1st,1941.
Even has the "blown in" price update sheet! Price $12.00.

PEERLESS Transformers, Catalog 1948 - 1,original owners name
on upper right hand corner, nice info, not perfect but nice,
Price $8.00.

SNC Transformers, January 1, 1947,13 pages plus original owners name
spelt on upper right hand corner,beautiful copy, has "blown in"supplimentary
catalog page,price sheet, and August price update sheet! Price $8.00

STANCOR Essex #2,069,42 pages, a REAL NICE MANUAL/CATALOG,has EVERY thing!
A real good info source,Price $15.00

STANCOR Essex Catalog # 140 H, 21 pages plus Numerical index and
October 1, 1948 price update list, very nice, $12.00

THORDARSON "Transformers by Thordarson, No. 400-FX 1942, A beautiful
source of info, 27 pages, Price $12.00

THORDARSON 1941"Tru-Fidelity by Thordarson, an UNBELIEVABLE catalog, real
nice pictures of early Broadcast transmitters and an excellent source
of audio info, 19 pages,real nice. Price $15.00

UTC Transformers, reactors, filters, Catalog# 500,looks like early 40's
another real nice, illustrated Catalog/manual, 22 pages, Price $12.00

UTC transformer components, Spiral-bound Excellent catalog/manual,
really in depth, Bulletin# PS-405,)ct. 15, 1941, includes "blown in"
price update for Dec. 6, 1946.Another excellently illustrated info
source, 34 pages, Price 15.00

EITEL-McCullough's "THE CARE AND FEEDING OF POWER TETRODES", 1951
25 pages crammed full of information IN DEPTH! Has everything you
ever wanted or needed to know about running these tubes, a real

nicely illustrated easy to understand manual, Price 15.00
Thanks for reading, if you have any questions or need to order,
Please respond to my mailbox...
Thanks, Joe Pratt,
Tubelit@aol.com

Steve,

It most likely controls the control grid bias
voltage.

Making that voltage more negative should lower
the resting plate current.

You may also want to make sure that your screen
voltage has not increased beacuse of some
regulation device gone bad.

Dennis

> words, go to 11 meters.

Spammer,

Was that comment really necesary?

I can find the same thing on many of the HF
amateur bands and on repeaters where the mike is
built into the hand-held and the desk may be clean
and pristine!

Rude people are not necessarily on 11 meters,
they may also post rude and/or degrading comments
on a newsgroup.

1541. Royce Osc design info needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-21 00:00:00 UTC
From: artky1k@northlandlink.com
Message-ID: <35dddb7d.19656116@news.tds.net>
Source record: 79976

Hi Everyone,

I need design information for Royce Oscillator PSU's.

The general purpose assy's available from surplus places are way oversized and therefore are not suitable for my needs.

I need regulated AC, at 600 to 800 volts. But, my peak current will be typically in the nanoamp range and will NEVER exceed one or two microamps.

The kicker is that I need the absolute lowest quiescent current, so a smaller transformer and the associated design parameters need to be optimized.

If anyone has information about Royce PSU's, please pass it along.

Thanks.

Art.

1542. Re: QUESTION:Making Circuit Boards..

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-21 00:00:00 UTC

Source record: 79977

Don,
Haven't tried the majik paper, but that is where I got my idea. The film is made by Techniks Inc.(also known as Press-n-Peel) and costs $30 for 20 sheets. You can re-use it if the iron isn't so hot that it ripples the film. I use lacquer thinner to clean the film to re-use it. I have tried transparency film, but it won't hold up to the heat and the toner won't transfer correctly because the transparency surface is not slick enough. Even the Techniks film will "pull" some of the toner back off the board when you remove it. I have found this is especially true when the trace you're trying to make is very narrow.
The "suede" paper I used was originally purchased to modify line art. We found that the toner could be removed (very carfully) by scraping the toner with an exacto knife and then we could redraw over it with drafting pens. Since then we have gone to a CAD system and had a bunch of this paper left over, and the ability to scrape the toner off gave me the idea of using it for pcb's. Perhaps, glossy ink jet paper would work as well, but I haven't as yet tried that.
And yes, ferric chloride is still used to etch the boards.
Hope this helps you.

>receiver may cover) for lots of electronic gear. So, if the rigs were "opened
>up" from the factory, they wouldn't be approved.

Further, I suspect...

It makes economic sense to try to make one circuit board work for as
many models as possible. So, the same CPU and/or frequency
synthesizer board might be used in a 2m ham rig, a VHF-high commercial
rig, and an aircraft radio. Jumpers/diodes can be used to tell the
CPU what kind of radio the board is installed in - what frequencies to
operate on.

So why not just open them up to operate on all frequencies? The ECPA
is part of it. Other countries have even stricter regulations along
these lines - for example, monitoring police is illegal in many
places. Also, while a 2m radio may work at 165MHz, because of the
analog circuits it may not come anywhere near meeting the spurious
emission or power-output specs. (note how the ads for many radios
state that specifications are only guaranteed within the ham bands?)

Transmitters (except those solely for the amateur service) must be
type-accepted for use in the U.S.. To be type-accepted, they must
meet spurious emission (and other) standards. Making a radio that
will meet these standards across a wide band like 132-174MHz would be
VERY expensive - many rigs are designed to meet standards across a
smaller bandwidth like 144-148MHz, and are professionally realigned if
they must be used in a different part of the band.

Hi.
I have built a similar spectrum analyser using a cable TV tuner. I put the sweep on the tuning pin and take the video out of the AGC pin on an IF chip. It works a treat.
I mix 1-50 mHz up to the first range of 110 - 300 and use the other tuner ranges direct. Result 1-800 mHz.

i am blind, and i have my extra class also, and i have learned about ham
radio, i had my picture in the sept 1990 issue of cq mag doing packet
radio, so i got into computers big time. so the heck with ham radio.
i am learning something new now. i got started in radio at a early age.
I am 42 years old as of tomorrow, so i have been in radio for a long time.
i have also been into broadcasting for a couple of years. the computer age
is taking over now, so if you want to get younger people into ham radio,
you might as well forget it. you are whipping a dead horse. n4pge

TRUELY THE HAM EVENT OF THE YEAR FOR THE BUFFALO AREA!!!

The Greater Buffalo Hamfest and Computer Show will be held this
Sunday. The location is the Hearthstone Mannor, 333 Dick Rd. Depew,
NY. Take the NYS Thruway to Exit 52 (Walden Ave.) go east on Walden to
Dick Rd., turn left on Dick Rd. and its is on your right.

Outdoor fleamarket starts at 6:00AM

Building opens at 8:00 for indoor vendors

Talk in 147.255+
Over 3 Acres of Fleamarket area
13,000 Sq ft of indoor space
Food- Breakfast, snacks, lunch
VE EXAMS
Free Parking
Prizes every half hour
Tailgating spaces free
Rain or Shine

FOR MORE INFORMATION, CLICK ON TO:

Source record: 79987

Years ago (before Radio Shack) there was a catalog house out of Chicago called Allied Radio who had a splendid catalog that everyone used as reference. From this, came the term "ACE" .... Allied Catalog Engineer who was a guy who was always modifying equipment to make it work better.

This was in the early days of CB and there was always a resistor in a new rig that had to be clipped out to increase the performance of the set somehow. People would come in an buy a new CB rig and immediately want the salesman to show him this "magic" resistor!

Back then. ham equipment was very expensive and most hams built theer own transmitters or modified WWII military gear. The popular AR HF command transmitters were used and were probably one of the best harmonic generators ever designed. Staying out of other people's TV sets became a major ACE endeavor. Back then they sold for $45.00 and you could take one and saw it in half with a hacksaw and make a neat VFO. Interestingly, you still see them listed on old radio lists and they still sell for $45.00! Somebody must be building them in their basement!

So, "mods" have a long history in Ham Radio!

You know, the neat thing about Ham Radio in my experience is that there has always been room for everyone. 80 M has long been a Saturday afternoon hangout for the old guys sipping their martinis, 40 and 20 meters for the DX and Contest maniacs, and the upper bands for the guy that wants a simple rig in his car to talk across town.

As for myself (one of those older hams) I still get a kick out of hearing a CW signal and wondering where it is coming from, just like I did when I was kid. It is even more exciting if I am hearing it on a simple piece of equipment that I have built myself.

Now, that's now for everyone and I suppose that excitment is there for people who are in Ham Radio for other reasons. If it is, I'm glad for them .... it's what its always been about!

The MFJ 552 at $59.95 plugs into a HT and converts it to a FM tone-modulated CW rig, certainly an economical approach to CW on 2M. That's the way I would go, but nobody on 2M in my locality is interested in CW and I would probably get run out of town if I keyed the local repeaters with a CW signal!

You are traveling on a straight path at 60 mph.

There is a storm front approaching at 50 mph.
The storm front is a straight line.

You look in the mirror behind you and see that
it is storming there.

Can the storm front over take you?

Sure, it can. All that is necessary is
that the storm front be approaching your
path at a sufficient angle.

Its the same with the wave guide.

Let's try this:

Phase velocity is a *property* of a traveling wave.

Under appropriate conditions, this property can take on a value
exceeding C even though the associated wavefront does not.

This property is not a physical entity - merely a mathematical, defining
property.

Modifying this property in some systematic manner does not imply that
some physical law has been violated.

Very ancient chestnut. The phase velocity vp is actually the speed of a
point in a geometrical pattern, like, say, the vertex of a pair of
scissor blades. Open or close the scissors and the *point* travels very
fast, but no *energy* travels with it. The energy, and thus the
information in the modulated wave, travels at group velocity vg, and vp
x vg = c^2. So the energy travels slower than light.

I think you've locked your brain into the wrong mode by
thinking of it as a video signal. Instead of picture data,
think of filling video RAM with the data for a repeating
sine wave, and you have pure CW. Bandwidth depends
entirely on the data content.

Message-ID: <35DCBEBD.263E718C@bellsouth.net>
Source record: 80040

HI all,

I have been making circuit boards for a few years now, and have usually used the clear film to run through the laser and then iron onto the copper. That gets expensive after a while and have seen advertisements using paper as the transfer medium for the toner. I decided to try this on my own and got some "suede" paper - it has a sheen on both sides. I printed my pattern on it, ironed it on the copper, soaked it in water,,,, and it worked. The paper was a little hard to remove, but it did work. Has anyone else tried this or used a certian kind of paper?? Is there some chemical that can be added to the water to disolve the paper and not hurt the copper or toner? If so I would be interested to hear what you did and how it works...

OK Dennis
I admit I was rude and should not have written such a degrading comment!

Listening on the ham-bands i.e. ssb-pileups makes you think you really listen to a buch of monkees. But still I feel that the percentage of active operators tend to "behave" at least a bit better on the ham-bands than CB (this counts for EU not sure about NA).

But what I wanted (intended) to say was that if it takes an effort to acheive something you want then usually you want to keep it and enjoy it.

Lets have easy access to HAM-radio but with limited privileges, and then help those who wants to upgrade. I am not saying it must be CW but then the amount of work to acheive the privleges should be the same.

Here in europe we hear all sorts of strange things going on on 11 meters, the gentlemen seems to stay away from this band. Why I do not know. I am sure the situation is much better i the States.

Years back when we got a technical license with VHF privileges only the FM-activity increased enormously. Most of the new operators came from the ranks that previously used 27 MHz. Intersting is that the amout of foul language and stupid behaviour began to increase too!

Now 11 meters is more or less dead here with little or no activity, and somehow 2 FM is gone too. Most people went to packet and then to internet.

But many of those who got really bitten by the HAM bug did upgrade and are still active. I doubt they felt that the work involved in upgrading was a chore, I feel pretty confident they enjoyed it as much as I did!

Cheers

The best way is always dependant on several things, but if your consern is that never say never go over a certain level, then use a power attenuator and run the rig on full power. Using the ALC would work but usually you get nasty power surges when the ALC is just to kick in. This can and will destroy any sensetive components such as mixers and FETs!

Hello Jonathan,

This may be the perfect troll . . . but, here goes:

The manufacturers don't, necessarily, "put mods in their equipment"!!

I suspect some brilliant ham or whiz kid examines the circuitry of a new model to determine what components (or programming) limit the range of the equipment. Then, they devise the means to extend the range. Of course, in some cases, these so-called "MARS/CAP mods" are available from the manufacturers to allow those operators to utilize the rigs on the frequencies for which they are licensed.

The reason the rigs are made as they are is to allow them to gain FCC approval for sale in the US. Without this approval, the rigs could not be legally sold here. As you may know, the Electronic Communications Privacy Act and other statutes prescribe certain standards (including limits on what frequencies a receiver may cover) for lots of electronic gear. So, if the rigs were "opened up" from the factory, they wouldn't be approved.

As for the danger of someone trashing their rig while attempting a "mod" - you pays your money and you takes your chance . . . If the result of the "mod" is worth the risk, then have at it. If not, don't . . .

Regards,

Bill

Source record: 80053

Andre: Is there something special about this power supply, aside from price, you're interested in?

There are probably less than 5% of hams who operate from home using a "base station" and not a mobile running off a 13.8 VDC power supply. Most of us use the mobile as a base station. I always have. They are cheaper and more available, for two reasons.

Think ahead for when you get on HF, which will most likely require a 20A or more power supply, then invest a little more into the PS you buy. You could use a 35A supply, commonly available. I've had mine for 18 years and it's rarely been turned off. Astron. There are other good brands out there as well.

You can use a deep cycle trolling motor and a low capacity charger (1-3A) as well. If you do, make sure your room isn't too airtight, so as to allow safe venting. Or, you can make one. It will cost more than a store-bought PS but you'll feel good.

Get a good PS, not a cheapo. You want to be able to put the thing on the floor and forget it. Mine has a meter and I regret spending money for that feature. Voltage never changes and the amps drawn are whatever they are, so what's the point?

73 and do good Andre. de Lance W9EMI

We are planning to use one of the ADI DDS parts in a design we are working on, but I was not aware that they have a 400MHz version coming out. Is this the clock speed meaning an output of ~200MHz max., or do you mean the output is 400MHz. Do you know where I can get details on the part. If it is cost effective, we could use it in one of our designs.

You might want to try Mobil 1 synthetic motor oil. It has some
advantages over petroleum based oil; in particular, better heat transfer
properties and lower volatility. I've been using it in a dummy load for
over 20 years with no problems.

Marty,

I would expect that you would have to derate the load with Mobil 1 since the viscosity of motor oil is higher than that of transformer oil. That is also a problem with mineral oil. Higher viscosity translates into slower convection currents in the oil and thus a lower rate of heat transport between the resistor and the container.

I am beginning to take up electronics as a hobby
Could any one out there give me some help

I would like to construct a FM transmitter (input is condenser mic)
that is small and needs a short antenna
clear transmission and moderate range (about 1/4 of a mile)

The receiver can be of any dimensions preferably small
clear reception
output is earphones or/and speakers

Thanks a million for your time
Zonghe

use a resistive pad to absorb the rf. you will hv to manually relay
switch the pad during rx and tx. this is the safest way.

Two problems with a PC power supply. If the PC is fully loaded you might be near the upper load limit of the supply. Also if you do use the PC supply you will introduce the digital RF noise into your shack by putting two unshielded/filtered lines from the PC into the rats nest we all know as the power/coaxial bundle behind the op table...

From: Don Corbitt <donc@analogia.com>
Message-ID: <6rkafn$fct@q.seanet.com>
Source record: 80065

I'm a programmer and a pilot, but not an electronics specialist. I just joined with a group of people who are working on an idea called Taillite (been in the design stage for a few years now), which would serve as a beacon to indicate position and direction of airborne objects (planes, balloons, parachutists) for collision avoidance.

Basic overview - GPS position signal is broadcast every few seconds, depending on how fast you're moving, so other aircraft can watch out for you.

The volunteers so far seem to be able to handle the GPS and CPU/logic portion of the design just fine, but I haven't heard anyone say they are comfortable with the transmitter/antenna design. (Maybe they're just shy :-) If anyone here wants to jump in and make suggestions, or even contribute to the design, join us on the Experimental Avionics mailing list. Fairly low volume most days, not too much silliness, etc.

We are looking at something in the 900 MHz band, either in the HAM (demo-only) or avionics bands up there. (If I sound vague it is because I don't know what I'm talking about :-) We'd like to do a high profile demo at an airshow in the next year or so. If this is interesting join the mailing list by sending any message to <avionics-subscribe@analogia.com>. Thanks.

here is one for you...
in a waveguide there can be a phase velocity that is greater than C

So if a signal is phase modulated, could the information travel greater
than C?

Have you tried a 1/4 stub cut at the channel 42 carrier?, cost's little
to try. Before spending big bucks on commercially available fixes, I
think it would be wise to be insure the problem isn't the television
it'self. A strong signal can enter the set directly and overload the
receiver.

That's OK!

I didn't even expect a reply; I just wanted you
to think about it a little!

> Listening on the ham-bands i.e. ssb-pileups makes you think you
> really listen to a buch of monkees. But still I feel that the
> percentage of active operators tend to "behave" at least a bit better
> on the ham-bands than CB (this counts for EU not sure about NA).

I'm not sure....

You could be right, but I feel it's because there
are more places for the good HAM operators to go
to to get away from the troublemakers.

The 11 meter band operator does not have that
luxury!

Assuming that the 'GOOD' 11 meter operator wants
to stay legal, he has only 40 choices of
frequencies he may use.

Since there are so many 11 meter 'users', there
is a high probability that there will be at least
one 'troublemaker' on each and every one of those
40 choices of frequencies he has to use!

> But what I wanted (intended) to say was that if it takes an effort to
> acheive something you want then usually you want to keep it and enjoy
> it.

I can't argue with your logic.

> Lets have easy access to HAM-radio but with limited privileges, and
> then help those who wants to upgrade.

Don't we have that now?

> I am not saying it must be CW
> but then the amount of work to acheive the privleges should be the
> same.

OK! But if we act like these 'skills' are so
important as to be needed for a license upgrade;
then we should also consider them important enough
to make it a requirement that every operator who
holds this upgraded license be required to
re-certify periodically. Maybe once a year; maybe
only once every 5 years; but if we don't do that
it looks like we are just creating obstacles for
the sake of creating obstacles, and nothing else!

Besides the code proficiency, there should be
some construction involved with the advanced
licenses; like have them (the testing body, VEC or
otherwise) give you a bunch of parts and a
breadboard and you will be required to build a
simple CW transmitter with them. After all, this
is an emergency radio service we are providing
isn't it? Isn't that how we obtained the radio
spectrum we currently have; to provide alternative
radio communications in case of a national
emergency?

Maybe this would weed out some of the 'appliance'
operators who would be dead in the water after the
first EMP from an air burst over the great lakes!

> Here in europe we hear all sorts of strange things going on on 11
> meters, the gentlemen seems to stay away from this band. Why I do not
> know. I am sure the situation is much better i the States.

It's not!

The problem is it only takes 40 operators with
high power and an 'attitude' to ruin things for
thousands of 'gentlemen'.

> Years back when we got a technical license with VHF privileges only
> the FM-activity increased enormously. Most of the new operators came
> from the ranks that previously used 27 MHz. Intersting is that the
> amout of foul language and stupid behaviour began to increase too!

I believe it. But if they are ignored, maybe they
will become 'disenchanted' and simply go away!

> Now 11 meters is more or less dead here with little or no activity,
> and somehow 2 FM is gone too. Most people went to packet and then to
> internet.

So they did go away!

Sounds like a fresh opportunity for some
'gentlemen' to start setting a good example!

> But many of those who got really bitten by the HAM bug did upgrade and
> are still active.

Are they still using the foul language and stupid
behavior?

>I doubt they felt that the work involved in
> upgrading was a chore, I feel pretty confident they enjoyed it as much
> as I did!

So maybe the lowered license requirements
worked. Out of hundreds of newbees, a few good
men were found!

Have a good day!

Try a mini-R2 and LMB ....It's LOW power but you can build an RF amp for it
from designs in the ARRL handbook and several other amateur books and mags.
I'm using a similar setup with a 2M to 6M transverter to give me dual band
capabilities. Works great. Projects with the R1, R2, mini-R2,T2,and LMB have
been in various issues of QST for homebrew or you can buy kits from:
http://qrp.cc.nd.edu/kanga/.
Check with area ham clubs. Many of them have back issues of QST in their
libraries. Good luck and have fun.

Doug,

Do you have a bunch of 813 sockets you want to
get rid of?

Also, take a look at the 4X150A tubes. They have
the same exact ratings as the 4CX250B's, but are
more readily available and usually much cheaper!

Well, I'm just now trying to find out stuff too, so I'm more of a question asker than a good contributor. I know about the majik paper that costs a fortune. Is that what you used? If not, what is suede paper? Please tell me more. What kind of transparencies were you using that worked and were expensive? Are they the same stuff used with a laser printer to make viewgraphs (for overhead projectors)? I'm also interested in what you use to etch. I havent made boards in about 10 years, but I do remember that the ferric clhoride in little bottles was rather expensive and slow. I hope that my jumping in here doesnt cause this thread to degenerate from your original subject too badly.

To combine two 8-bit DACs to a single 16-bit one, you divide the
voltage of one by 256 and add this signal to the second one. I
don't understand why you want to multiply something. But anyway,
an 8-bit DAC alone gives you alreaqdy 46 dB SNR, which is more
than OK for first lowest power experiments.

Hi W4ZCB
Well, as you would expect it is not brilliant but I can see down about 70-80 dB. I use an old Tek 465B.

I have not yet built a log IF strip, didn't seem to need it yet.

A better (I hope) Mk 2 is in progress as follows.
I have modified a Sharp Sat IF tuner 920-2150 mHz by removing its TV IF SAW filter (IF 479.5) and replacing it with a saw oscillator resonator RFD inc on the same freq (100kHz wide.) This tuner has a built in IF and AGC system so I ought to get video out of that based on the new narrow IF.

I will mix 1- 916 mHz by using a cheap RFD saw osc on 916.5 mHz so I can view it in the 916-1832 range.
Result should be 1- 2150 mHz. ..... I wonder if it will work?

Small delay in this project whilst daughter gets married then I can return to it!!
Watch this space..

Hello,

I am looking to setup my Hp117 for better reception, I think my computers in my house must be putting out more rfi than i thought, because when i turned them off for a couple of days my radio shack wwvb was showing the correct date and time. i thought we could not get the station in ny but there was evidence and it was no where as sensitive as the hp 117.

i did see an article in radio electronics for 1973 about a loop antenna and several rx's for the 60khz outlet. it seems that ideally the bandwith of the front end should be under 300hz, i saw mention of units that had a bandwith of only 3hz, using modern circuits does anyone out there have any ideas on achieving this?

Have you tried a 1/4 wave "stub"? It works fairly well for the
cost of 4" of coax.

If you want to "roll your own", try searching for a shareware
program called "tunekit.zip", usually contained on Ham sites. It
is a cute little program that will calculate all the values
needed for various multipole filter configurations.

Good Luck!

Type-acceptance is much more about what kinds of control the user
has over the radio. Land Mobile type-acceptance is primarily designed
to make certain that users can only operate on specific assigned
frequencies and with specific PL tones.

There are a lot of radios available today that operate over the 146-174MHz
range without anything but reprogramming, i.e., no realignment required.
This isn't the issue.

Is not a VGA card basically three D-A converters interfaced to
appropriate logic?

I would certainly think one could feed the appropriate bitstream to
get a reasonably narrow-bandwidth signal. Taken to the extreme, one
could switch from 0-0-0 on R/G/B to 255-255-255 to generate a CW
signal, only a few Hz wide. Obviously such a signal would not be
displayable on a VGA monitor!

I don't think I'd use it under my license without attaching a bandpass
filter to the output, but it strikes me as a project that might be
possible.

73 Doug

If it is three D-A converters interfaced to appropriate logic they are
running at 10's of Mhz or more. I still don't know how you would turn this
into a signal only Hertz wide. Even high speed CW isn't this narrow.

The scissors and storm front analogies are great! Thanks for
posting those. I recall reading and rereading a section about phase
velocities in a waveguide exceeding c and it just never sunk in what it
meant. This analogy really cleared it up.

First you fill the frame buffer with a pixel pattern like the one shown
in Figure 1 on

http://www.cl.cam.ac.uk/~mgk25/ih98-tempest.pdf

or say an equivalent CW signal (f_t=0). Then you amplitude modulate
this CW signal by quickly rewriting the the color lookup table of
your VGA card. You can do this modulation via the color lookup
table as smoothly as you want, resulting in a CW signal that is
as narrowband as you want.

Modern VGA cards contain 3 DACs with typically 150 MHz
at 8-bit. For a start, just use one of the three DACs, but by
cascading two you can theoretically get even 16-bit resolution
(cascading three is probably not practical).

You can reprogram video chips such that the sync pulses and
blanking intervalls are gone. This way, you can get any spectral
shape you want without much additional bandpass filtering.

Modern PC graphics cards are cheap extremely powerful universal
function generators; connected to a fast processor over a fast bus
they are a rich source of lowest-cost homebrew experiments. CW signal
generation is just the start. You can easily do spread spectrum
modulation and even (with a simple external integrator connected to
your soundcard, which you use as the narrow band ADC) spread spectrum
demodulation. In PCI bus systems, two graphics card can nicely
coexist next to each other, so you do not have to loose your
user interface while generating signals.

Source record: 80001

Another power supply system that is relatively inexpensive is a small "deep cycle" 12volt garden tractor type battery with a AC/DC trickle charger to keep the battery charged up. Price for the small 12v deep cycle battery at W-Mart is approx $25 and a low amperage trickle charger shouldn't be too much either. With this system , you will have emergency power capabilities as well and you can always unplug the battery and take it with you for remote power applications.

You do it the same way as any DDS does. You feed byte values to the
D/A converters corresponding to a Nyquist sampled sinewave at the
operating frequency. You can store this as a lookup table in video memory
and the video circuitry will read it out automatically for you. Feed the output
through a simple RC reconstruction filter and you have a good sinewave
signal at any single frequency you choose.

Now that only requires one channel. You have two more (RGB). You
can use those channels to provide quadrature channels which you can
combine externally to make an arbitrary waveform I/Q modulator. Thus
you can generate FSK, PSK, SSB, etc all from just a video card, a couple
of external mixers, and a bit of semi-clever programming.

There's one gotcha here. That's video blanking. If your video card's chipset insists on inserting it (this is sometimes programable), you need to make the reconstruction filter narrow enough to remove the sidebands produced by the blanking. That limits the utility of the video card for RF generation. It is best if you find a card where blanking insertion can be defeated, or programmed to be very narrow, thus easing the requirements on the reconstruction filter.

That's not CW, that's MCW. It has all the disadvantages of FM voice operation without the advantages of the speed and convenience of voice usage. Except for Morse practice, it serves no real communications purpose (and it is forbidden on the 144.0 to 144.1 MHz segment of 2m anyway). To get the narrow bandwidth and improved SNR advantages of CW, you have to actually use CW equipment.

You can key an *unmodulated* FM transmitter on and off to generate CW, but to receive it you need a very different receiver from an FM receiver. About the cheapest way to get that is to use a receiving converter in front of a HF SSB/CW receiver, or go high buck and buy an all mode VHF rig.

But you can use the FM equipment to get the same sort of SNR improvement offered by CW (actually about 9 db better at the same character rate) if you use it for wide shift low rate FSK. That requires no modifications to the transmitter, only a minor mod to the receiver, and the addition of a wide shift TU. (You have to use wide shift, if you try to use narrow shift, you have to modify the FM receiver's IF filter or your SNR will degrade very sharply.)

Wide shift FSK has considerable resistance to multipath fading too. (You'd have to use it above 144.1 MHz, though, since A1A is the only emission allowed below 144.1 MHz.) A suitable wide shift TU is easy to build, or you can program a sound card to do it. So you can use FM equipment for Dx type weak signal operation, but not in CW.

This weak signal method has seen very little use on VHF amateur radio, but its advantages are large for anyone with FM equipment and a computer (or terminal). Remember that Shannon must be obeyed, to get the weak signal advantage over CW, the information rate has to be slowed to equal that being used by the CW operator, and the TU has to be optimized for that rate. This is *very* different from VHF packet. That equipment won't work. It's pretty amazing the first time you see perfect copy on a signal when all you can hear on the speaker is white noise.

I think he's looking for something to operate in the CW only region, MCW isn't what they do there. The OLD VHF handbook has a nice simple transmitter circuit that puts out about one watt, it's designed for FM use, but I built one and left off the audio section for use with RS10 several years ago. Worked fine (on low passes) :)

Yeah... that is the 3 cm and 10 cm band. There is or was a 5 cm band, but it is not used on merchant vessels. Typically a ship has both a 3 and a 10 cm set, but is often only using one or the other since the magnetron has only a finite operating lifespan. The 3 cm band is used by SARTs, by the way.

The cost of a low power radar suitable for a small yacht is not really a factor... you can get something for well under $2000. On a sailboat, of course, the unit may draw too much power to run continuously unless you have a light plant constantly running. On a powered vessel, though, why not just buy a radar? The only reason I see for having a passive radar detector is to enable somebody to be warned about the presence of a radar equipped vessel without his own presence being detected. I won't publicly speculate on why anybody would want to do that. Anyway, my recommendation is to just install one of the little Raytheon or Furuno sets and learn how to do a radar plot if the set doesn't do it automatically, and then you will know not only whether or not there is a ship in the area, but you will also know CPA (closest point of approach) and be

able to accurately alter your course and speed for an acceptable CPA (A CPA of "0" is undesireable). You will also know the other vessel's course and speed, and be able to detect a change in either one.

If you are just using the detector as a "snooze alarm", DON'T! You are asking for disaster. To my knowledge, there is no EXPLICIT requirement either by treaty or, for U.S. flag ships, by 46 CFR, to constantly operate a radar. Only the presence and suitability of radar is a requirement. You could easily find yourself bulbous-bowed in your sleep by a ship blissfully unaware of your presence because they did not have a radar working, and your anchor or running lights were out or dim. Most modern radars have a settable proximity alarm and while I firmly believe that somebody should be on watch at all times, if you MUST all go to sleep at the same time, whether at anchor or underway, at least the radar's proximity alarm is operating in an ACTIVE mode, and not relying on the presence of another radar to set it off.

Don't be a statistic... get a real radar. forget about all the stop-gap gadgets. You may even get a break on your insurance if you install one.

I remember a "CB/Ham Radio" store in my hometown many years ago. They
mostly sold CB rigs, the only "Ham" equipment in the store consisted of
power amplifiers, no other ham gear in sight.

No points for being specific Butch, assuming you want a xtal for somewhere
in 40m and not one for exactly 7MHz you can try the following site. The
crystals they have are the small type that will fit your transistor socket.

No problem:

I have not yet seen a common PC graphics card where you cannot
completely freely reprogram the width of both the sync pulses and
blanking intervals. How to do this under Linux with an XFree86 server
in a portable way even without reading the data sheet of your
video controller is explained e.g., on

http://sunsite.unc.edu/mdw/HOWTO/XFree86-Video-Timings-HOWTO-9.html

How are you going to cascade them? You can cascade multiplying DACs,
but video board DACS are generally not multiplying DACs and all three
are in a single package.

You *could* use some sort of outboard analog multiplier to multiply
the output of two DACs together. Making this work at 150 MHz might
still be interesting.

At 36 years younger than the average General, you certainly are. Now
consider that in 1963 before the Incentive Licensing fiasco the average
age for a General was 29. Quite a difference wouldn't you say?

>Just My Thoughts,
>Martin, N3ZNF

Well congratulations, Martin, but you are a rarity. The average age
for Extra is 54. so you and your friends are about 40 years younger
than the average amateur holding your class license. There are too
few of you to bring that average down to a value representative of
the general population demographic. And that's the major problem
HF amateur radio faces. It has a rapidly aging demographic, and not
enough young people like you joining it to bring the average age
back down and stablize it at a healthy value.

In 10 years, if demographic trends don't change, half of our Generals
will be dead. In 20 years, if demographic trends don't change, half of
our Extras will be dead. And new amateurs aren't entering those classes
at the bottom of the demographic curve at a rate which will replace them.
Now a die off will certainly rectify our demographics, but not in a healthy
way. We need to get more people your age (or at least under 35) to fill
those soon to be vacant slots and bring our demographics back in balance
without a population collapse.

Most amateurs don't seem to realize the seriousness of this problem.
Many take an "I'm all right, Jack!" attitude, or simply don't understand
the ramifications of the issue. Others seem to actually cheer on the idea
that amateur radio is doomed, and that they'll be among the last ones to
enjoy it. I find those attitudes appalling.

When I see something broken, my urge is to fix it. Amateur radio's
demographics are broken, even if everyone doesn't realize that yet,
and need to be fixed, now, before it is too late. An amateur population
whose top classes are in serious decline, which ours will be if we don't
act soon, makes us vulnerable to those who would push amateur radio
aside and take our spectral resources. Without those, there can be no

amateur radio.

Now I know that our HF spectrum is currently not under any serious threat. That's not the issue. With our top classes in decline, the entire service becomes vulnerable, despite a relatively healthy population of Techs at the bottom of the food chain. The *perception* becomes the political reality. And the perception will be that amateur radio is dying.

I'm talking about your future here, Martin, and the future your children will have. If something is not done soon, those futures won't include amateur radio, or at best will only include a pale and attenuated imitation of what we know as amateur radio. I hope you don't think that's Ok.

There was a fellow selling one at a local non ham flea once, an aluminum box with a red pilot light, it had an on/off switch no doubt wired to the pilot lamp and another switch marked Sideband / AM when I asked him about it he said it was a 100 watt amp. It weighed about 10 oz. Im sure some fool actually paid money for it.

1. This pattern creates an AM signal (your examples showed 300 and 1200 Hz
modulation). These signals are more than a few Hertz wide.

2. I think there is still a communications problems here. I took the
orignal poster to say you could transmit the video display of a VDU, over
some narrow bandwidth. Apparently, this is not what you are saying. If
anyone does come up with a scheme to fit a 100 Mhz video signal into a few
Hertz channel, they'll be rich.

You do it the same way as any DDS does. You feed byte values to the
D/A converters corresponding to a Nyquist sampled sinewave at the
operating frequency. You can store this as a lookup table in video memory
and the video circuitry will read it out automatically for you. Feed the output
through a simple RC reconstruction filter and you have a good sinewave
signal at any single frequency you choose.

This is NOT the same as transmitting the VDU video, which was my point.

Now that only requires one channel. You have two more (RGB). You
can use those channels to provide quadrature channels which you can
combine externally to make an arbitrary waveform I/Q modulator. Thus
you can generate FSK, PSK, SSB, etc all from just a video card, a couple
of external mixers, and a bit of semi-clever programming.

There's one gotcha here. That's video blanking. If your video card's chipset
insists on inserting it (this is sometimes programable), you need to make the
reconstruction filter narrow enough to remove the sidebands produced by
the blanking. That limits the utility of the video card for RF generation. It
is best if you find a card where blanking insertion can be defeated, or
programmed to be very narrow, thus easing the requirements on the
reconstruction filter.

I think you've locked your brain into the wrong mode by
thinking of it as a video signal. Instead of picture data,
think of filling video RAM with the data for a repeating
sine wave, and you have pure CW. Bandwidth depends
entirely on the data content.

Rick Kerman <rkerman@mail.bright.net>
http://www.bright.net/~rkerman

You are right. I'm talking about actually transmitting the video displayed on the VDU. What else would one want to do in industrial espionage? A narrowband AM signal with some tones on it tells me nothing about what is on the screen.

MC3356 has 70dB RSSI range operated on 8,985MHz IF, but it needs careful
adjustment. I checked it using accurate signal level generator.

Ok, I see how that would work. But I wouldn't call that "cascade"
Cascade always implies some sort of serial connection (first it
goes through this one, then it goes through that one). And I was
trying to figure out how you were going to do that.

But just adding the outputs with one of them scaled down is better.

Dave

My turn.
The Analog Devices AD603/AD8307 pair yields 120 dB linear in dB dynamic range in 300 KHz bandwidth at 10.7 MHz. Better yet, the 8307 log amp is under $7.00 in single quantities, and is stable as a pussycat with only a couple of chip capacitors for decoupling. (It will give the same results to better than 50 MHz and needs NO adjustment.) That's more dynamic range than you can get out of a good front end. Barrie Gilbert ought to get a medal.

Right! This is NOT what we want in the weak-signal sections of the band! A REAL CW/SSB rig for that section should have a clean, stable CW/SSB signal.

I recommend the KK7B R2/T2 combination for anyone wanting to homebrew a rig for CW or SSB for this part of the 2-meter band. It performs very well.

Allan,

I can't help you with your antenna design, but I beleive that WWVB has
recently increased their output power to improve reception across the USA.
That may explain why it comes in a little better in NY. Good luck.

Yes, modern graphics cards are nothing but lowest-cost direct digital
synthesizers. You can use them to generate test signals and also
to generate broadcast signals. The sampling clock can be programmed
in high resolution over a typically 15 to 150 MHz range. The blanking
intervals can be reduced to zero. The modulation is done by
software. You can even abuse the color lookup table in the RAMDAC
as a quickly reprogramable multiplier (for software AM), multiplexer
(for software FSK) or non-linear element. This was what we were
talking about.

Gustavo:

You have the honor to have built the largest signal generators I have ever seen! Your Polarad FIM-B, a 1-12 GHz monster that needed 4 plug-ins to span the range, was such a behemoth that it had two fold-out foam cushioned steel handles on each side so that two guys wouldn't loose circulation in their fingers when they had to move it from bench to bench. It was about 24" wide by 24" high by 30" deep, and used another identical sized box for a power supply. The plug-ins were a marvel of mechanical complexity, with something like three cam-followers riding on circular ramps created by side-by-side rows of set screws. Now there was a design that didn't need no stinkin' synthesizers!

Skip,

I have a couple of SL6440C 14 pin dip ICs. I bought them for a project years ago but never used them.

The IC has the following markings:

PS SR
SL6440C
8426A

Does $5 ea + shipping sound like a good price? Let me know.

Marc

at 60kcs, a BW of 3 hz would imply a Q of great value.

why design something so overKill? a tuned loop achieves this quite nicely. i built a 9' tuned loop some years back, and reception of wwvb in seattle was quite impressive. front to side ratio was better than 80dB.

For Sale: My parts collection for an 813 final amplifier consisting of
the Following:

2 each NIB RCA 813 tubes, serial numbers match the boxes
2 each Johnson ceramic tube sockets for 813s
1 each New 10volt at 10 amp CT fil xfmer, vertical shell mount
1 each 2 Pole 12 position Ceramic Band Switch Many KV insulation
like new removed from HV test set
1 each Jennings 500 Pf at 5Kv vacuum variable, 1/4 inch shaft, very
nice condx
and compact design
1 each 4 section closed space variable cap for loading in excellent
condition
approximately 1600 pf all sections in parallel
6 each 1/2 inch ceramic slug tuned coil forms for pi input network
GG
2 each 500 pf/20kv Cermic Door Knob coupling caps
1 each Alumitronics 195-1 plate tank assembly 80-10 meters, used but
styrene in
good shape. Will need added inductor for 160 meter and
will include
separate section of new coil stock for that band
2 each Matching panel meters, square design kind of like S line
meters only next
size up, 500 MA and 300 Ma or shunt to desired value
(1 ma basic movements)
1 each 54 Ufd/3500 volt Oil cap

1 assortment 3 amp/ 1kv diodes on ceramic terminal assemblies for
either a
full wave bridge or voltage doubler.
2. each KRP style relays, 12VDC coils, DPDT contacts (10 amps each)
with
mating flat mounting octal sockets with screw terminals

2 each Amperite 30 second thermal timer relays N/O 115VAC fil. NIB

2 each open frame relays for t/r switching, good insulation and modified
for RF
work, 12VDC coils

1 each Cloned BW-800 plate choke--not checked on WARC bands or 160

2 each SO-239 connectors

2 each N type chassis mount (if you prefer N)

2 each 1750 volt/270 MA ccs plate transformers with 115/220 primary with FWB and the oil cap noted the unit will send out around 2250 volts or more at 400 ma all day long to the 813s.

I'll include copies of 813 amplifier designs from various sources including input network design information for gg tuned circuits etc.

The metal work is your challenge. hi hi.

The package as noted $275 plus UPS ground on around 70 lbs from my zip 95827. take off $75 and about 50 lbs if you don't want the plate transformers and the oil cap. I want to keep the rest of the package together if possible.

tnx es 73

I need some help for a friend. He just picked up a FT-73r, and wanted to mod
it so that he could listen to his businesses freq but not x-mit on it. However, the
radio dosen't work much outside of it's designed limits. RX drops off pretty fast. He
says that there's a pot inside that'll widen the radio's RX and TX up. But without
the service manual, figuring out which it is isn't easy. Can anyone help him out?
He dosen't have internet access, nor even a home computer, so I'll relay
messages for him.
P.S., if you think he's doing this to mess around with other freqs, he's most
definately not. He's 67, and he's a Vet who strongly believes in not breaking the
law. I've known him long anough to know that he's straignt. Besides, as a precaution,
he's going to set the Tx freq to something so far out of band that TX power will be 0
watts. With this ht, that's easy.

Source record: 79878

Hi,

I have a SONY ICF2010 receiver that covers AIR (116-136 Mhz), FM and HF (150kHz to 29.999).

I would like to increase the bandwidth of the AIR band for covering the 137Mhz and receive the WEATHER SATELLITE. Anyone has tried that kind of modifications? I know that I have to change the IF bandwidth.

Thanks in beforehand for your information

Best Regards

Hi Rich,
I don't think any mods are required as such, but I would not waste the tubes in the 30L1 as the limiting factor is the ability of the fils to emit and in that application the 811As do just fine. The extra plate dissipation is fine, but with a plate supply that is limited in key down capacity the extra plate dissipation is of questionable value. Sell the 572s and buy twice as many 811As is my suggestion. But that is an opinion and I could be wrong.

For sale;
Eimac CV-400 cavity amplifier (no power supply).
Uses 8874/3CX400 ceramic tube. Eimacs 100% duty cycle rating is 300 watts FM.
Could do 600 watts on SSB, CW, ATV, etc.
Needs 2000 volt HV Power supply and filament supply. This is a cavity type
amplifier and is set up for 450 mhz but the size of the cavity is adjustable
form 400-500mhz and can be use for approxiamtley a 20mhz spread. I have a
digital picture that i can email for those who are interested.
$325+ shipping.
Thanks,
Jim W3ATV

1673. HF MOBILE AMP KIT (RF PARTS)

I purchased a HF Mobile Amp kit from RF parts a year or two ago and lost
the schematic and kit booklet. I think the kit instructions and printed
circuit board was manufactured by a company in the Phoenix, AZ area
(EDCO or ETCO or ??).
DOES ANYONE KNOW THE NAME OF THE COMPANY OR HAVE A SCHEMATIC?
It has a pair of 2SC2879's in it.

The "AIR" band uses AM. The weather satellites use FM. So the problem is greater than whether you can extend the frequency coverage. I've read that some scanners allow you to use the FM detector in the air band, while others don't. But this doesn't apply in your case, since the receiver doesn't cover any VHF two-way FM segments. It doesn't have a narrow band FM strip. I'd be quite surprised to find any way of using the FM broadcast band IF strip with the AIR band front end.

The FM problem is more immediate than extending the frequency coverage, and since the former can't be done, the latter isn't important.

By the way, I gather from reading that the weather satellites use wider deviation than regular two-way FM, and when combined with doppler shift you need a wider IF bandwidth than is available in narrow band FM receivers. ON the other hand, the bandwidth of an FM broadcast receiver is too wide, and will lack sensitivity and give low recovered audio, at best.

Hi OM,

I fondly recall the days of ARC 5 command sets. I, like many thousands of other hams, used one on 40 CW, with 900V on the plates of the 1625's (we could abuse the 1625's; they were only 10 cents each, new!). However, your quoted prices on ARC-5's are an order of magnitude higher than what we paid back then (mid-50's). I once bought one for $1 from J.J. Glass surplus in L.A., due to the fact that it had bullet holes in it! J.J. used to have entire pallets of ARC-5's stacked up like blocks, several feet high, for $5 each. But $5 was a lot of money for me then.
Yes, I currently have an ARC-5 XMTR and RCVR, and yes, they still work on the air just fine. One of the joys of CW operation is that just about ANY rig other than spark, regardless of age, is still usable. I run mine direct to the (resonant dipole) antenna with no TVI whatsoever from a TV set sitting on top of the rig. I think many new hams today could benefit from tinkering (and the technical learning that comes from it) with ARC-5's. After a lapse of over 40 years, I found that it is still just as much fun as it was back then. Glad there are still some of them around to be rediscovered.

73,

In SSB speech usage where the average power is at least 6 dB below PEP the power supply is OK for the higher PEP of the 572's. For extended two-tone or CW (contest operating) it is probably not a good idea because of pwr xfmr overheating. Also, the filter capacitors should be replaced with more modern higher microfarad types (see RF Parts Co catalog). Also, use 220 V line.

Hi Bill,

My application is running key down in RTTY.

Under that operation what do you believe would be a max *steady* power
level? As is now, I run at reduced power 150-180 watts for fear of
frying the tubes. I was thinking that if I changed to 572's I could
raise this to where the power transformer would be the limiting
factor.

What do think?

Danny

1.) Remove amplifier from cabinet.

2.) Remove top cover to gain access to final tubes.

3.) Replace 811As with 572Bs.

4.) Reassemble in reverse order of steps above.

5.) Turn it on, tune it up, and enjoy!

Seriously, you should have no problems making a direct plug-in replacement.
Don't get hung up with "purist" notions like "something else may fail because
of higher power capability, etc.". Most Collins equipment was designed for
military applications and have inherent safety factors. You will probably be
using for for SSB - not key-down continuous duty anyway. Lots of guys have
made the switch to 572Bs and I have never heard of a problem.

In the 30L-1 with 811's the pwr xfmr is already the limiter, especially in RTTY, and my manual recommends 50% duty cycle for CW and not more than 30 seconds continuous key down. I recall from a long time ago that 500 W input and short duty cycle for RTTY is suggested. I do not recommend the 572's for RTTY at all unless the instruction manual is followed closely (OK for SSB speech). In my 30L-1 with Svetlana 811-As the xfmr gets plenty hot during extended usage in a CW or SSB contest.

1687. Help with old radio direction finder for physics project

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-24 00:00:00 UTC
From: Jason Powell <fizzx@wi.net?delete_the_?>
Message-ID: <6rsog3$8o0$6@news.inc.net>
Source record: 79895

Sorry if this message is not related to the purpose of this newgroup.
I'm trying to get information for a high school advanced physics project.

Before school starts I decided to throw away a bunch of junk that's been in our old storage area for perhaps decades. Way
back in a corner piled over with junk I find, much to my surprise, a radio direction finder with instruction manual.

Here's the specs:

Sanfreshin Digital Direction Finder MDL RDF-501D

3 bands, Super-Hetrodyne system w/1 RF amp.,stage

Freq - Beacon: 175KHz-400KHz, Broadcast: 535KHz-1605KHz, Marine: 1600KHz-3999KHz

Sensitivity- Beacon: 45 microV/m 50mW, Broadcast: 30microV/m 50mW, Marine: 30microV/m 50mW

Antenna: rotating bearing antenna, vertical sense antenna

Noise ratio: 20db

Selectivity: 30db/10KHz

IF: 455KHz

BFO: mod freq, approx 500-800Hz

Output: 400mW

And it runs on 4 D cells.

I slapped in batteries and it works! Or at least it came on. Although designed for marine navigation, I'm hoping I might be able to use it to track high power rockets (find where the heck it landed). Heck, the manual has a little section on Homing (tune in to transmitters freq, steer the boat so that the null is kept on the meter).

Now the question is are there transmitters that will fit in a rocket and broadcast at the freq the unit picks up?
Can high school students with little electronics skill build one? If so, what do we need to get and how do we put it together?

PLEASE RESPOND VIA EMAIL as I just subscribed to about 20 radio newsgroups and can't possibly scan each one :-)

>73, Zack W9SZ

By the way, I have experimented very much in making clean keying
performance. Key-clicks are banned. But it seems not many other cares to
avoid clicks. I made two 2m beacons running at 12-1500LPM (250WPM) using
ex-PMR units (PYE T30FM) exciter boards. The easiest way to key the
exciter and have optimum suppression of signal in pauses was to build an
analogue sort of 'am-modulator' - connecting a 3rd order lowpassfilter
to the keyer and using a two transistor combination to key the supply
voltage to the last three stages of the exciter.

The closest thing I've seen to homebrewing a 2 m cw rig is a 2 meter transverter from a 10 meter rig - this is available from hamtronics (the same company that also puts out kit repeaters and other things).

They're on the web too... www.hamtronics.com.

I remember seeing two different 2 meter transverters, and I can't remember if either one operated down to 144.0 - 144.1. They did have one that was made for the satellite sub-band on 2 meters.

You may have to get a 10 meter rig that can be opend up to operate down to 26.000 MHz so that you can tune the transverter all the way down to 144.0

The impression I get from hamtronics is that their equipment is pretty prime quality... it's not the sort of chintzy kits that you can get from Ramsey. (my opinion)

Just browsing over at their site ... the CA146-28 offers receive downconverting from 146-148 for 28-30 MHz receiver. If you called them and asked, they might be able to tell you if it will also convert 144-146 if you could operate 26-28.

Good luck!

There's a whole group of amateur radio operators that already do something similar to what you are hoping to produce.

If you do a search TAPR (Tuscon Amateur Packet Radio (?))and APRS (Automatic Packet Reporting System), you should be able to learn a little bit about how hams have taken GPS locating capabilities and broadcasted them through digital radio networks. This would allow someone to follow a car, boat, or airplane over the radio.

Most of these systems currently in use are at 1200 baud on VHF (2 meter) frequencies. Because of the incredibly high congestion you may encounter in the aviation application, you may want to consider something like 9600 baud or faster with a 10-30 second interval. 900 MHz could do it - especially something about 1 watt or less since everything is line of site between aircraft.

The other advantage to such a system (since it is easily integrated with a computer) is to have the capability for keyboard to keyboard chat, or system wide bulletins/anouncements. The same system could just as easily place a storm on everybody's screen so that they could see where the center of the storm was located.

Regarding the concern about an RF designer, it may not be necessary - there are places already producing radios compatible with digital modes... I'll have to do a little more looking through my adds in magazines, but if you get the Trade-A-plane magazine, call them and ask about the Amateur Radio Trader (same company... maybe different offices). In there, I've seen a commercial radio manufacturer that produces digital ready radios - if you need me to dig this info up... let me know :)

I think your biggest problem will be the FCC approval/licensing - that might hold you up longer than acquiring the actual radios. (or you could find a bunch of hams willing to help you out)

I've succesfully used the 1200 baud/2-meter system to track 1 or 2 Cessna 150's for about 50 miles. The only problems I had with tracking was the GPS - one GPS was a Garmin 45 which locks up beyond 90 nm/hr - when it locks up, it still transmits, but it does not transmit any useful location, speed, heading information. The other - Garmin 90 - worked fine beyond 90 nm/hr. I understand that Garmin makes a GPS w/o a screen or case (just a circuit board - Garmin 20? 25?) that is a lot cheaper and works beyond the 90 nm/hr limit.

The advantage to the 1200 baud system is it will work with any common "voice" radios. (The cheapest option in amateur radio for this is an MFJ brand packet radio ~$100-$120) The speed is slow enough to work over the FM voice channel. In the case where you went to 9600 baud or faster, you would need a specialized radio designed specifically for that purpose... and they are available (the MFJ packet/data radio also handles 9600, but not anything faster).

73 and good luck,

Daniel

1694. Looking for Cannon-type Plugs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-24 00:00:00 UTC
From: wb5agz@dc.cis.okstate.edu
Message-ID: <6rs221knb1@sunhub-tulsa.onenet.net>
Source record: 79902

I have a coax-switching relay for which I need to find a matching connector for the contactor motor. The relay uses N-type coax fittings and switches one of three to the active position. The connector is one of those military-style round Cannon plugs with four male pins arranged in a square in the center. The body is about the diameter of a PL259 coax fitting and there is a collar that screws down to hold the connector together. I plan to use this relay outside so I want to find the right matching connector and not just improvise and then have to climb the tower every other day to fix it.

Are there any companies that might deal in these type connectors? I don't even know the nomenclature that would correctly describe the plug.

Excellent paper, I read this one a few months ago. I also hacked together
a simple program to compute video patterns which emit signals in the AM
broadcast band, which were audible in a little pocket radio out to about 12
feet. A cute parlor trick.

>or say an equivalent CW signal (f_t=0). Then you amplitude modulate
>this CW signal by quickly rewriting the the color lookup table of
>your VGA card. You can do this modulation via the color lookup
>table as smoothly as you want, resulting in a CW signal that is
>as narrowband as you want.

Gosh. Color me blind, I never thought of implementing AM modulation
by modifying the color map. I'll have to give that a shot! Excellent
notion.

>Modern VGA cards contain 3 DACs with typically 150 MHz
>at 8-bit. For a start, just use one of the three DACs, but by
>cascading two you can theoretically get even 16-bit resolution

Hello All,

If you have a 10 meter rig, an alternative would be the TenTec 10M to 2M transverter for $140.

What ever mode your HF rig will give you 10 watts out on 2 anywhere in the spectrum.

Comes kit or factory made. (Which costs more)

All of the 12-channel Garmin units have a speed limit of around 1000
knots, instead of 90 knots. So any of the current handhelds would work
fine, if you want a GPS that you can use handheld as well.

But for something to permanently build into a special-purpose airplane
locator, you probably want either the GPS 25 (bare board, you supply
antenna and power supply and housing) or the GPS 35 (GPS and antenna in
sealed enclosure with power supply - you supply 12V or 24V power.

G8ACE recently described a method of making a laser print on paper and ironing the toner on to the clean copper board. Then he removed the paper by soaking in water for a few minutes and peeling it gently away, followed by undiluted domestic bleach to dissolve the last of the fibres.

The type of paper he recommended - after many experiments - was Epson Glossy Inkjet Photo Paper SO41126 (NB inkjet paper, but laser printer!) He says this gives better resolution than normal press-n-peel PCB film because the paper comes right off without lifting the toner.

WIth a 600dpi printer he has used this technique to print parallel-line filters for 24GHz so it can't be bad!

The SB200 uses 572Bs.

No matter what tubes you use, the power supply will be limited. As I recall, the 30L1 is limited to very short transmit times in RTTY. It's designed primarily for SSB or CW.

what's wrong with building your own alfred slot antenna? use a Dremel tool to cut out the center slice from the waveguide. or, build your own waveguide out of brass sheet stock. even if frequencies change somewhat, why can't you tune it with a waveguide stub tuner?

Hi All,

I have just spent over an hour making at least a half dozen calls across the country. You'd think that in that amount of time i'd be able to find a company willing to sell me the VPL-1D programming kit for the FTH series portables and the VXR series repeaters. Most of the companies that I spoke with said that they can sell this kit to adresses in their own state or export only. I have been unable to speak with the Yaesu rep. that covers Utah(based in Denver, go figure?).

I have 12 of the FTH-2009 radios and I need the programming cable and software. Anybody have pinouots for the cable? Can anybody help me out?

After today, I am of the belief that Yaesu software is harder to obtain than Motorola RSS.

Thanks in advance!!

Dan Dialogue

That's the best advice I've heard. The 30L-1 is a nice, compact amplifier for SSB and CW, but even with the 572B tubes it wouldn't be your best bet for RTTY. It just wasn't designed for that kind of operation. Rebuilding the power supply with the Dahl xformer may help, but Dahl transformers aren't cheap (nothing good is) and I'd bet money that the thing would still run hot on RTTY due to the compact nature of the amplifier and the relatively small cooling fan. I kind of think that any modifications might hurt the resale value of the amplifier as well.

The old SB-220 amps, although not designed for 100% duty, will deliver more power for the buck. I ran an SB-221 on RTTY at about 400W out a few years ago, including a few contests, and it didn't mind. The one I ran did have a larger fan installed on the rear, and another one on the top to try to get some additional air through the amp, which I'd recommend. With a little shopping around, you oughta be able to find a SB-220/221 for a little more than the 572Bs and the Dahl transformer.

1715. Re: Looking for Cannon-type Plugs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-08-25 00:00:00 UTC
From: Carl Bauman <cbauman@impulse.net>
Message-ID: <6rvr34$i8v$1@sienna.impulse.net>
Source record: 79784

Since some of the power plugs were somewhat standardized, I am going to guess that the receptacle number is AN-3102-14S-2P. If that is the case, the mate is AN-3106-14S-2S. It is listed in the Allied catalog as part of the Amphenol line of 'Formerly MIL-C-5015 Types A and B', but if you look at the ordering information, all the numbers are there. Don't forget the cable clamp. There is a waterproof clamp available, but looking at the connector pair I have, I think I would consider some additional waterproofing.

Allied Electronics number is 1-800-433-5700 or http://www.allied.avnet.com

Due to the number of options available, you should get a catalog, if you don't have one, to make sure you get what you need and the current pricing. Feel free to reply to this post if you need more data or if you can tell us what is the actual number of the connector.

Good luck,
Carl WB6YFZ

Well, just going by the math, if the formula for Rout is correct (Rout = Sqr(Vcc - Vcesat) / (2 x Po) = 101 Ohms), then assigning 0 to Vcesat (best case) results in:

Sqr(5) / (2 x Po) = 101 or Po = Sqr(5) / (202) = .0111 W = 11 mW

Is this close to what you're actually getting?

OOPS! I think I may have confused Sqr (square) with Sqrt (square root). In that case, the math is correct.

Would the SBA-2001-1 QSK board manufactured by Heath for their SB-1000 work with the early SB-2xx series? (it was factory assembled and I think also used by Ameritron)

The one I have was modified with IN4007 diodes in place of the pin diodes (which I believe were MA4PH301's), what cautions are in order to be sure it will still perform safely with the SB-2xx series amps (assuming it will work with them at all)?

BTW: Anyone have the specs for the MA4PH301 device? I'd like to compare them closely to the IN4007. I am particularly interested if there is a significant capacitance effect due to the substitution within the 1.8-30MHz range of operation.

Thanks & 73, DavidC AA1FA--

Hi, I found a much cheaper printer that has the same High-resolution LASER duplicator, so I am able to pass along the savings to you. IF YOU HAVE ALREADY ORDERED and sent out your money for these, the you will get a rebate on the difference in price, so this is fair to everybody. Thanks, the amended post follows:

Hello, I have the following literature that is out of print, and very hard to find. These are very high resolution LASER monochromatic reprints of the rare originals. All are professionally done with original style binding. All sales final on literature, and I'm sure you'll be pleased. All prices INCLUDE POSTAGE, in the continental USA. Others by actual quote.
Thanks, and if you need tubes, visit our sister screename, Tubecntral@aol.com

TRANSFORMER BULLETINS/CATALOGS/MANUALS:

KENYON "Quality transformers",23 pages,has some writing in numbers on the front cover by the original owner,but a real information getter. Covers ALL transformers available in Dec.1st,1941. Even has the "blown in" price update sheet! Price $9.00.

PEERLESS Transformers, Catalog 1948 - 1,original owners name on upper right hand corner, nice info, not perfect but nice, Price $8.00.

SNC Transformers, January 1, 1947,13 pages plus original owners name spelt on upper right hand corner,beautiful copy, has "blown in"supplimentary catalog page,price sheet, and August price update sheet! Price $8.00

STANCOR Essex #2,069,42 pages, a REAL NICE MANUAL/CATALOG,has EVERY thing! A real good info source,Price $10.00

STANCOR Essex Catalog # 140 H, 21 pages plus Numerical index and October 1, 1948 price update list, very nice, $9.00

THORDARSON "Transformers by Thordarson, No. 400-FX 1942, A beautiful source of info, 27 pages, Price $9.00

THORDARSON 1941"Tru-Fidelity by Thordarson, an UNBELIEVABLE catalog, real nice pictures of early Broadcast transmitters and an excellent source of audio info, 19 pages,real nice. Price $10.00

UTC Transformers, reactors, filters, Catalog# 500,looks like early 40's another real nice, illustrated Catalog/manual, 22 pages, Price $9.00

UTC transformer components, Spiral-bound Excellent catalog/manual, really in depth, Bulletin# PS-405,)ct. 15, 1941, includes "blown in"

price update for Dec. 6, 1946.Another excellently illustrated info source, 34 pages, Price 11.00

EITEL-McCullough's "THE CARE AND FEEDING OF POWER TETRODES", 1951 25 pages crammed full of information IN DEPTH! Has everything you ever wanted or needed to know about running these tubes, a real nicely illustrated easy to understand manual, Price 10.00
Thanks for reading, if you have any questions or need to order, Please respond to my mailbox...
Thanks, Joe Pratt,
Tubelit@aol.com

Danny,
Take the money you would spend on the 572's and buy an SB220 or SB200. The
3-500Z will easily handle RTTY and even the cheap Heath Power supply will run
400 watts for extended periods from a pair of 3-500's.

This line of thinking reminds me of a type of paper that is (or at least used to be) available at magic shops. It dissolves immediately in water. The word was it used to be used by the spy community decades ago. If I can find some I'll try it. If any one else can find some let us know about it.

I think in actual practice almost any non-conductive oil will work. All it's there
for is power disapation. Look at teh cantenna, they even put a 'sleve' to create
convection to draw the heat away and let the oil mix.

The 'real' oil, loaded with all kinds of nasty carcinogens, probably works the best, but would you notice it operating as a HAM? Most likely no.

However, just using vegetable oil may have some serious side effects. Specifically, will it react and cause the resistive element to deteriorate?

Remembering, this will be at elevated temperatures at times, and the element will be immersed constantly. If the element is cheap enough, try it.

If it were me, I'd try to get one of the 'ron reactive' silicon oils, and see
what happens.

Hi,
I am having a little trouble designing a 100mW transmitter. Could someone
please consider the following and advise me of any error ?

The specs are :
Vcc = 5V, F = 300mHz, Po = 100mW, Rsource = 50, Rload = 50.
Device = MRF559
Cout = 2pF, Zin = 6.5 - j20 (extrapolated from specs given at 400mHz)

Rout = Sqr(Vcc - Vcesat) / (2 x Po) = 101 Ohms

Output match is L-Match from 101 to 50 Ohms.
Values for match : Par C = 5.2pF, Series L = 26nH.
Par C adjusted to account for 2pF Cout = 3.2pF.
Coupling to load via 1nF cap.

1uH RFC from collector to Vcc.

Base Bias = 1uH RFC to ground.

Input match is L-Match from 50 to 6.5 Ohms
par C at source = 27pF , Series L = 19.2nH (after absorbing -j20).

Coupling to source via 1nF cap.

Please email response to

d.huisman@niwa.cri.nz

Regards
Dave Huisman

Source record: 79789

Thanks a bundle. I used the info you posted to change my radio back to America mode. There is a lot of extra things that I ignored since I wouldn't use them anyway. I am just glad I got it fixed without sending it to Yaesu. They are very helpful (in my experience), but I didn't really want to pay to have it fixed if it was somehting I could do myself. For obvious reasons, you would never get this info from them.

DC-to-DC Booster and Splitter Power Supply: Assembled, Kit, or Plans-Only.

Great for converting battery to split supply.

Converts 6 to 18 volts DC to up to 60 volts DC, AND up to +/- 30 volts DC, AND to +5 volts DC (four outputs), all at up to about 2.5 Amps DC. Peak current around 9 Amps.

Extensive noise and spike filtering of output.

Check it out, at:

http://www.fullnet.com/u/tomg/gooteeps.htm

Todd,

I can think of a few single-tube wood-based transmitters, using those tubes, from ARRL publications. Pre-war (c. 1938) there were one or two 6L6 rigs. After the war there was one that used a 6V6 (or 6F6 or 6L6) that appeared around 1947, and another used a 6AG7 that appeared around 1951.

73,
Mike, KK6GM

nope. 'fraid not.

AN-3106 = plug w/straight threaded shell
-14S-2 = size and *insert type*
S = pin gender

I was reading the numbers directly off the connectors, but the catalog has the info too. Mil connectors aren't as straightforward as commercial types, i.e. a '14S-4P' doesn't exist for this series. Also note that Martin said the pins were in the connector that he had, which means the mate requires sockets. Yes, they are expensive, about $20 should cover the cost for the connector and clamp.

The model railroad shops have decals for alphabets-and "settling fluid"
which softens the decal stock so they settle over details. Test it first
of your paint, though.

In Dec 1939 QST, there is an article called - The "Portable Five",
which uses 25L6GT as the oscillator and a 25Z6GT as rectifier. Should
be easy to replace the 25Z6GT with modern diodes. If you need a copy of
this article, let me know.

Hi Todd,

See December, 1946 QST for tri-tet 6V6 XMTR on wooden slats. It is
also in the 1949 ARRL handbook and probably others around that time
too. I built and used this rig out of an article in "How to Become a
Radio Amateur" in 1955. I still have this rig (and would not part with
it; it was my first rig).

Have fun!

Hi Todd:
Actually, that was my first TX also, I believe (it was a long time ago)
it was in the '53 Handbook. Built it from garbage collections, couldn't
afford to buy stuff then. Worked ok, but would get "Chirp" notices in the
mail.
Worst part was all the eves, using tooth paste, regrinding
surplus WW2 crystals!

But the Datak dry transfers come with complete electronic related words so you don't have to try and line up one letter at a time. Much easier! Someone said that dry transfers won't work on wrinkle finish but I did it again last night without a hitch.

Some thoughts on wrinkle finish and lettering.

Back in the early 70's I used to buy Gray and Black wrinkle paint from
General Cement at the local store. Put on one coat, let it dry for
about 10-15 minutes, spray on a second coat. I'd put it in the oven
in the kitchen and bake it at 250-350 for an hour or so. Nice tight
even wrinkles. I suspect some paints will do this even though it doesn't
say so on the can. :-) (As mentioned in a previous article)

For lettering, I used Datak dri-transfer letters. Use an orange wood
stick (available in most drug stores in the fingernail stuff section)
to transfer the letters, then use the tissue paper that comes with them
to lay over the lettering and burnish it into the paint/panel. They
stay where you put them then.

As for Dymo labels, heh, I still use them when I'm in a hurry. Or
out in the field. (Network ID numbers, Telco etc.) Besides, Fair
Radio sales has been using them since the beginning of time to lable
thier catalog. (As an aside, does anyone know how to make TrueType
fonts? I'l like to come up with a set of "Dymo Font".)

Another item I picked up at a Swap meet, was a Kroy lettering machine.
Not really good front panels, but works great for letting tool boxes
parts cabinets etc. (Unless you're really lazy like I am and use
Avery stick ons. Oh, and for parts cabinets, use the perminent file
folder lables, the "removable" ones fall off after a few years.)

Lastly, while you're in the "not really sure if it works" mode, use
a sharpie felt pen on aluminum and painted aluminum chassis. Semi-neat
and it washes off with lighter fluid after you figure out what you
really want to say on the panels.

Be careful with the 6L6 circuits, they can develop enough
grid excitation to damage some crystals. Use the mil. style
FT243 crystals. I cracked more than one novice xtal back in
the old days!

Others have mentioned the RTTY power supply insufficiencies of the 30L1.
I was planning on using 572Bs in my 30L1 until I came across twenty 811As
in various states of condition at the Foothill fleamarket for $5.00 -
some had holes in the plate, others looked great. I kluged together a
homemade emissions tester and found eight of them to be good. Sure was
a cheaper solution than using 572Bs.

Didn't some people put light bulbs in series with the crystal to limit
the current through it? That popped into my mind when I saw your comment,
yet a second thought leaves me unsure.

The reason they have protection is so that you can't duplicate it.
I'd be really disappointed if it could be defeated.

Actually, TEM means that the electric and magnetic fields of a wave are perpendicular to the direction of motion of the wave, not to each other. The abbreviations TE, TM and TEM designate wave modes with only the electric field, only the magnetic field, or both fields perpendicular to the wave motion.

On the last Idea of using a sharpie permanent marker to temporarily label aluminum panels : BE carefull. It usually works well, but in a few cases I was never able to completely remove the stuff, even with lacquer thinner, MEK acetone and several other solvents. I suspect It was a result of the specific surface finish or maybe alloy contents or something. Ive used this technique a zillion times and only had the problem a few times, but if you do, youll REMEMBER it!

The plain-paper technique, using a laser printer or copier, is described in "Ironing Out Your Own Printed-Circuit Boards" in the July, 1993 QST, page 42. The author's name is Grebenkemper if you need to request the article through your library.

The TVI / RFI of today isn't the same as we were fighting in those days. Then you worried about harmonics getting into the TV antenna causing TVI. Nowadays modern rigs are clean and most TV's are on cable. The problem today is electronics that picks up a signal on other than it's intended frequency because of poor design and shielding. Then you fought your neighbors because your rig was bad. Now it's their rig that's bad....and that's much harder to fight. Not to mention their computer that is QRMing your favorite band. Oh for the bad old days.

> were sure to loose a crystal---even the old, monster units! Cliff K7RR

I thought so, but my use of tubes was fairly limited. I was licensed in 1972, so while tubes were still common, solid state was already making a dent. I couldn't actually picture a single tube transmitter with a bulb in series with the crystal, but I did read Bill Hoisington's (K!CLL) articles on VHF/UHF in 73, and I'm sure he mentioned doing it.
